Gastric adenomyoma is a rare cause of pyloric obstruction. It was first recognized radiologically as a possible cause of benign pyloric stenosis by Campbell (1949). The histological features of the tumour were first described by Magnus-Alsleben (1903), who reported five cases discovered incidentally at necropsy. Since then 23 additional cases have been published. Four cases examined radiologically showed evidence of a benign pyloric lesion (Wass, McCloskey, and Sullivan, 1951 ; Cimmino, 1955 ; Goldberg and Margulis, 1966). Two of the standard radiological textbooks do not mention adenomyoma as a cause of pyloric obstruction (Shanks and Kerley, 1958 ; Lumsden and Truelove, 1965). The lesion is important clinically because of its histological similarity to heterotopic pancreatic tissue, which it may also mimic radiologically.

CASE REPORT

A 39-year-old housewife presented with a 10-year history of recurrent attacks of epigastric pain and vomiting. Pain was not relieved by antacids, was unrelated to meals, and was made worse when she ate meat and fatty foods. Her appetite was good except during the intermittent vomiting attacks. There was no history of shoulder pain, haematemesis, melaena, or weight loss. Clinical examination revealed some epigastric tenderness, but no palpable masses or other abnormality.

Investigations.—Haemoglobin 13.4 g./100 ml.; white cell count 4,700 cu. mm. ; erythrocyte sedimentation rate 10 mm. in one hour ; blood group A rhesus-positive. Barium meal: a small ulcer niche was demonstrated on the mid-third of the lesser curve of the stomach ; there was some delay in initial gastric emptying ; there was a constant narrowing of the pyloric antrum with two persistent niches of barium ; a pyloric filling defect was constant despite changes of position and palpation ; peristalsis was normal in the area ; the oesophagus and duodenal cap were normal. The appearances were unchanged on re-examination after one month.

Operative Findings.—A firm mass was palpable in the anterior wall of the pyloric antrum. A small benign lesser-curve ulcer was present. The distal two-thirds of the stomach was resected and a gastroduodenal anastomosis performed. Recovery was uneventful.

Pathological Findings.—There was marked narrowing of the pyloric antrum by a thickening of the submucosa and muscle for 3 cm. The submucosa was firm and grey, and up to 0.5 cm. thick. The muscle coat in the area was 1.2 cm. thick. Macroscopic spaces were visible in the submucosa and underlying part of the muscle coat. The histological appearances were those of an adenomyoma. Examination of various areas of the tumour showed areas of Brunner's glands and ducts lined by columnar epithelium surrounded by connective tissue and muscle bundles. A track was seen running from the submucosa into the gastric lumen. The lesser-curve ulcer was small, chronic, and benign.

COMMENT

Benign tumours of the stomach are rare and present with a variety of symptoms.

This patient's symptoms were suggestive of peptic ulcer with intermittent pyloric obstruction. The previously reported cases of adenomyoma have had various symptoms, including vague indigestion, epigastric discomfort, and chest pain. An epigastric tumour was palpable in one case (Gruzdeff, 1909). Adenomyoma has been described in association with infantile hypertrophic pyloric stenosis (Wass *et al.*, 1951). The lesion has always been found on the anterior wall of the pyloric antrum. On barium meal examination four cases showed pyloric narrowing and a constant filling defect.

A central umbilication, often described as being typical of leiomyoma or neurofibroma, which may also occur in the pylorus, was found in one case (Cimmino, 1955).

The pyloric niche in the present case corresponded to the track demonstrated histologically. Ducts opening into the pyloric antrum have not been previously described in adenomyoma and have been referred to as being typical of heterotopic pancreatic tissue (Lapidari, 1937). There is a close relation between these two lesions. Both originate from primordial epithelial buds which may develop in varying degrees of differentiation, resulting in the eventual histological spectrum of adenomyoma, aberrant pancreas, and hyperplasia of Brunner's glands (Clarke, 1940). The essential histological feature is the presence of differentiated and undifferentiated glandular tissue in the submucosa and mucosa of the pyloric antrum (Stewart and Taylor, 1925). The lesion is classified according to which cell type predominates: undifferentiated glandular epithelium and muscle whorls in adenomyoma, Brunner's type differentiated epithelium, or pancreatic type acini. Aberrant pancreas is the commonest of these. It is seen more often in males (Copleman, 1963) and produces pyloric obstruction in 25% of cases which occur in adults (Palmer, 1951). It is usually intramural and almost half the lesions are in the distal third of the stomach.

Apart from pyloric obstruction due to peptic ulceration with pylorospasm or fibrosis and the characteristic deformity due to pyloroplasty, there are many benign causes of pyloric stenosis. A pyloric mucosal polyp usually has a pedicle and is mobile. A congenital mucosal diaphragm, due to failure of canalization of the embryonic foregut (Conway, 1965), and the focal type of hypertrophic pyloric stenosis, the features of which have been reviewed by Seaman (1966), may both cause eccentric pyloric narrowing.

Much rarer lesions producing pyloric narrowing include eosinophilic gastroenteritis, which is associated with changes in the small intestine and responds to steroids (Wolf and Khilnani, 1966). Gastric sarcoidosis, tuberculosis, eosinophil granuloma, and tertiary syphilis may present with pyloric narrowing, usually in association with systemic manifestations of the disease, which assist in the diagnosis.

In the case described the lesion was thought on barium meal examination to be due to aberrant pancreas. Histology confirmed the diagnosis of gastric adenomyoma. The patient remained asymptomatic over a two-year period.

Spontaneous Rupture of Uterus at 22 Weeks' Pregnancy

Brit. med. J., 1967, 3, 844

CASE REPORT

The patient, a woman of 35, had had no children after 11 years of marriage. In January 1966, when 22 weeks pregnant, her uterus ruptured spontaneously. At operation twin foetal sacs were found free in the peritoneal cavity.

Her previous gynaecological history was complicated. A year before the uterus ruptured, after 10 weeks' amenorrhoea, she was said to have passed grape-like tissue during a vaginal bleed. Microscopy was not carried out, and this tissue was presumed to be hydatidiform mole. During the next four months she had intermittent episodes of vaginal bleeding but no proper period. A diagnostic curettage was therefore done, when fresh products of conception were evacuated; she continued to bleed, and eight days later a further curettage had to be performed. At this operation the uterus was perforated. Shortly afterwards she had a normal period.

Five months later she presented with amenorrhoea of 14 weeks' duration, and a pregnancy consistent with 18 weeks' gestation was felt. This proceeded normally, apart from the discrepancy between the uterine size and period of amenorrhoea.

The day after a visit to the antenatal clinic at 22 weeks she was admitted complaining of sudden and severe abdominal pain, with vaginal bleeding. There was no history of trauma or uterine contractions. On examination there were no signs of circulatory collapse. The abdomen was distended, with tenderness all over. The uterus could not be delineated either abdominally or per vaginam. There was some vaginal blood loss.

A diagnosis was made of intraperitoneal bleeding from either ruptured uterus or ectopic pregnancy. At laparotomy twin foetal sacs, each about the size of a 22-week pregnancy, were found free in the peritoneal cavity, which contained about 750 ml. of blood. The uterus had contracted to the size of a 16-week pregnancy, and in the midline of the fundus was a tear through which a finger could be passed. The foetal sacs and blood were removed, and, since the patient had had no children, a simple suture of the tear was performed.

Her recovery was normal. A hysterogram six months later showed a small filling defect in the fundus. In September 1967 the patient was 30 weeks pregnant, and so far all was well.

COMMENT

Rupture of the pregnant uterus before the onset of contractions of labour or abortion is rare. Published reports are few. The above case presented the combination of twin pregnancy with a previous uterine perforation and possible hydatidiform mole. The largest collection of spontaneous rupture of the apparently normal uterus is that of Felmus *et al.* (1953). Of their 121 cases a quarter had had previous uterine instrumentation. In three cases trophoblastic invasion of the myometrium was given as the immediate predisposing cause. One-third of their cases ruptured before the sixth month of gestation. In the above case the uterus had ruptured in the midline of the fundus, where a perforation would most likely be. Characteristically, the pregnant uterus ruptures through the body; the uterus in labour ruptures through the lower segment.

It is unusual for the foetus to be extruded completely through the rupture. In the present case both sacs were free in the peritoneal cavity. Because of this the uterus had been allowed to retract and thereby diminish the extent of the tear. This probably lessened the bleeding and would explain the patient's good general condition. Most reports describe the patient as being shocked.

The treatment of choice is hysterectomy, the subtotal operation being done if speed is necessary. Two cases of repeated rupture of the uterus in a subsequent pregnancy have been described after simple suture of the tear (Lazarević, 1932; Wenner, 1949).

I would like to thank Miss Lois E. Hurter for permission to publish this case.

Diaphysial Aclasia with Compression of the Spinal Cord

Brit. med. J., 1967, 3, 844–845

In their review of 1,102 patients with diaphysial aclasia Stocks and Barrington (1925) found that only 7% had vertebral osteochondromata. If these occur within the spinal canal they can cause compression of the spinal cord or the cauda equina. The first case was described by Ochsner and Rothstein (1907), but since then very few cases have been recorded. Slepian and Hamby (1951) could find only nine certain cases of cord compression. They added a further case, and three more cases have been reported (Cannon, 1954; Gokay and Bucy, 1955; Larson, Dodge, Rushton, and Dahlin, 1957). This makes a total of 13 cases, and, since diaphysial aclasia is not a very rare condition (Jaffe, 1958), cord compression is an unusual complication.

CASE REPORT

A schoolgirl aged 16 presented with a sudden onset of clumsiness of the right hand, which rapidly increased. This was followed a month later by weakness of the right knee.

On examination she had typical generalized diaphysial aclasia. The neurological examination showed wasting and weakness of the intrinsic muscles of both hands and weakness of the flexors and extensors of the right elbow and wrist. Abduction and adduction of the right shoulder were also weak. The reflexes in the right arm were weak or absent. There was a mild spastic paresis of the right leg, but both plantar responses were flexor. There were no abnormal sensory signs apart from poor position sense in the fourth and fifth fingers of the right hand.

Investigations.—Radiographs of the cervical spine, including tomograms, showed exostoses arising from the spinous processes and laminae of the fifth and sixth cervical vertebrae (Fig. 1). A myelogram showed a posterior filling defect at the level of the fifth cervical vertebra (Fig. 2). Lumbar puncture showed nothing abnormal apart from a protein of 58 mg./100 ml.

Operation.—Exostoses were found on the back of both the laminae of the fifth cervical vertebra. A laminectomy of the fifth and sixth cervical vertebrae was performed and two exostoses were found on the front of the lamina of the fifth cervical vertebra (0.5 and 0.75 cm. in diameter) and one larger exostosis (1 cm. in diameter) on the front of the lamina of the sixth cervical vertebra. These were indenting the dura mater. Histology showed that they were typical osteochondromata.

After operation she developed retention of urine, which cleared within three weeks, and a month after operation she had almost normal power in all four limbs. During the next year she had intermittent episodes of mild weakness of the right leg and both arms, but has had no further neurological symptoms for the past three years.

She also suffered from congenital mitral incompetence, which was first noted at the age of 3 but had produced no symptoms.

DISCUSSION

This patient was younger than the others recorded, who have all been past the age of skeletal growth. In all other respects she represents the typical features of this unusual complication of diaphysial aclasia. The osteochondromata pressing on the spinal cord were small and arose from the deep surface of the laminae. All the previous cases have had similarly small osteochondromata within the spinal canal, apart from the case described by Gökay and Bucy (1955). That patient had a large retroperitoneal osteochondroma arising from the bodies of the second to the fifth lumbar vertebrae, with a dumb-bell extension through the neural canal between the third and fourth lumbar vertebrae which compressed the cauda equina.

Neurological recovery after removal of the osteochondroma is usually complete. In the case reported here there was some slight and variable neurological disability for a year after operation. The cause of this was unknown, but recovery was finally complete. Laminectomy and removal of the osteochondroma should therefore be performed as soon as the diagnosis is established by radiography. In one case (Larson *et al.*, 1957) the tumour was thought to be a chondrosarcoma. The possibility that the pressure may result from an increase in size of an exostosis undergoing malignant change is a further indication to explore the spinal canal promptly.

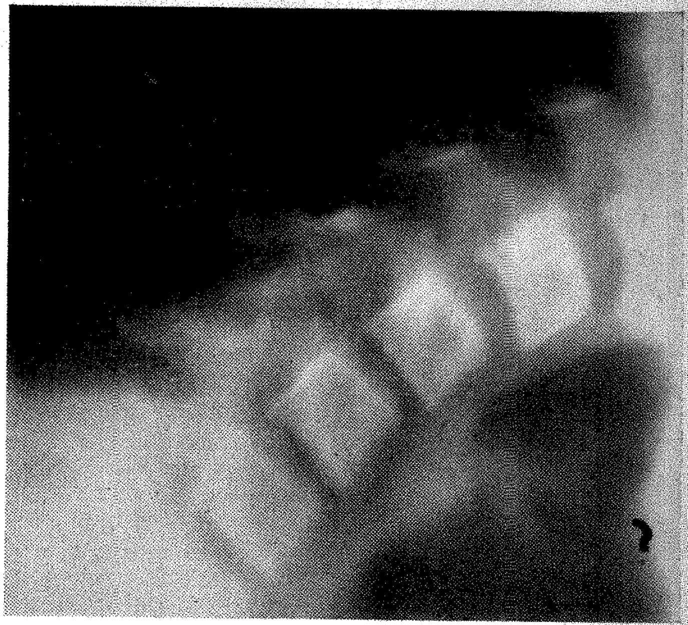

FIG. 1.—Lateral tomogram of cervical spine showing exostoses arising from the deep surfaces of the laminae of the fifth and sixth cervical vertebrae.

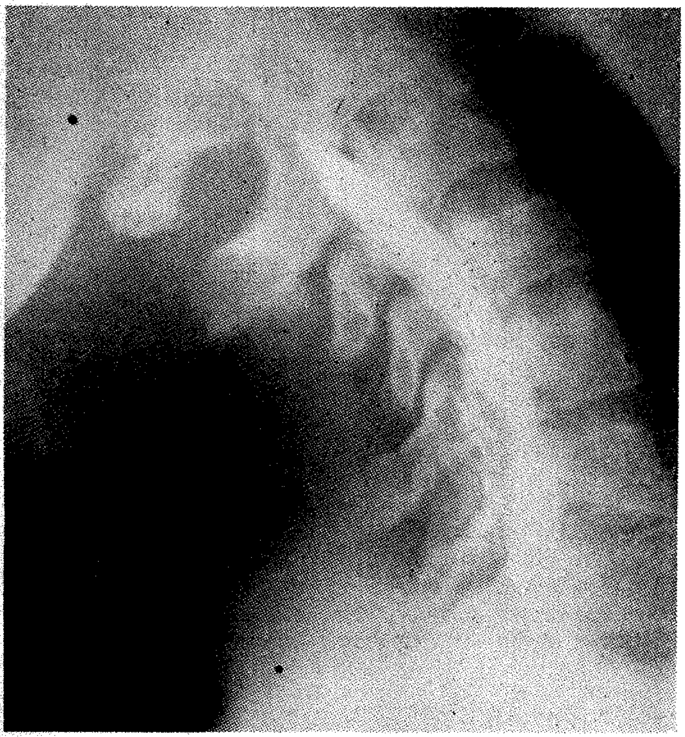

FIG. 2.—Cervical myelogram showing a posterior filling defect at the level of the fifth cervical vertebra.

I am grateful to Mr. J. N. Aston and Mr. R. Campbell Connolly for their permission to report this case. The photographs were kindly supplied by the Department of Medical Photography, St. Bartholomew's Hospital.

Current Practice

TODAY'S DRUGS

With the help of expert contributors we publish below notes on a selection of drugs in current use.

Immunization Schedules

Immunization schedules are intended to serve as guide lines for those responsible for ensuring that children are collectively and individually protected against certain communicable diseases. Suitable vaccines are available for immunization against diphtheria, tetanus, whooping-cough, poliomyelitis, measles, smallpox, and tuberculosis, but as they cannot be given together it is desirable to arrange a simple programme of immunization, taking into account what is safe, effective, practical, and most likely to result in the immunization of the maximum number of children. A number of factors have to be considered when constructing such a programme.

Combined and Simultaneous Vaccination

The number of injections to be endured by the child, the number of clinic visits to be paid by the mother, and the administrative costs to be met are reduced as a result of the incorporation of diphtheria, tetanus, and pertussis vaccines (D.T.P.) into one effective trivalent vaccine. In addition, simultaneous administration of oral poliomyelitis vaccine (O.P.V.) with D.T.P. further increases the efficiency of the immunization service without reducing the safety and efficacy of the vaccines.

Number of Vaccinations

A single administration of a live vaccine, such as measles, smallpox, or B.C.G., usually produces lasting immunity against the corresponding disease, but a single administration of trivalent O.P.V. may not result in simultaneous development of immunity against all three types of poliovirus. Second and third feedings are necessary in order to give each of the three types of poliovirus an opportunity of colonizing the intestines.

A single injection of pertussis vaccine containing killed organisms and of diphtheria and tetanus toxoids does not provide protection ; three adequately spaced injections are required.

Intervals between Vaccinations

Adequate antibody responses to the three components of D.T.P. are not obtained unless a minimum of four weeks elapses between successive injections ; even better results are obtained when the intervals are increased to six weeks or longer. Intervals of four to six weeks should also elapse between successive feedings of O.P.V., the reason being that one type of poliovirus may be prevented from establishing itself in the intestines while one or both of the other types are still multiplying, a process which may last four to six weeks after the initial infection was produced.

It is common practice in this country to allow six weeks between administration of measles, smallpox, and B.C.G. vaccines, although in some tropical countries measles and smallpox, or B.C.G. and smallpox, are given simultaneously.

Age of Immunization

The optimum age for administration of any vaccine is determined by a variety of factors.

The antibody response of infants to *diphtheria toxoid* and *oral polio vaccine* improves with age as the child's immunological mechanisms mature and transplacentally transmitted maternal antibodies are eliminated from the circulation. These factors argue in favour of delaying immunization until the child is 6 to 12 months of age ; but *whooping-cough* is a particularly severe disease during infancy, and therefore a strong case can be made for early administration of D.T.P. Most authorities now recommend that the course of D.T.P. with O.P.V. should commence between the ages of 2 and 6 months.

Residual maternal antibodies render live *measles vaccine* ineffective in most children under 6 months of age and in some until they are almost 1 year old. As a child becomes responsive to live vaccine so also does he become susceptible to measles. Routine vaccination should therefore be carried out after the age of 10 months, but should not be delayed long after the age of 12 to 15 months, particularly when a measles epidemic is expected. In some practices a dose of inactivated measles vaccine is given four to six weeks before the live vaccine.

Primary *smallpox* vaccination will "take" at any age from birth, but the risk of post-vaccination encephalitis, although low in infants vaccinated during the first year of life, is even less among those vaccinated during the second year. Smallpox vaccination should therefore be postponed until the second year of life.

All tuberculin-negative children in close contact with a case of *tuberculosis* should be B.C.G. vaccinated irrespective of their age. Routine immunization of tuberculin-negative children is otherwise carried out at the age of 11 or 12 years, thus ensuring that they are tuberculin-positive during puberty and adolescence, when the risk of tuberculosis would otherwise increase.

Booster Doses

The antibody titres produced by a course of D.T.P. and O.P.V. in infancy wane with time but are readily boosted by further administration of the vaccines a year later. A further booster dose of diphtheria and tetanus toxoid and of oral polio vaccine is required at school entry in order to maintain a high state of immunity. By the age of 5 whooping-cough is rarely a serious disease, and the pertussis component renders triple vaccine particularly reactogenic in these older children.

Practical Considerations

Immunization schedules should be simple to remember, easy to administer, and, when followed, prove to be safe and effective. A schedule involving three vaccination visits during both the first and second years of life would read:

Age	Vaccines	No. of Vaccinations
3 to 6 months ..	Commence course of three administrations D.T.P. + O.P.V.	Three at intervals of not less than four weeks
1 to 2 years ..	Measles vaccination, smallpox vaccination, booster D.T.P. + O.P.V.	Three at intervals of not less than four weeks
First year at school	Booster D.T. + O.P.V.	One
8 to 12 years ..	Booster D.T. + O.P.V.	,,
12 years	B.C.G. for the tuberculin negative	,,

Chlorocresol should not be added to solutions for intrathecal or epidural injection or when volumes over 15 ml. are to be injected at a time.

ANY QUESTIONS?

We publish below a selection of questions and answers of general interest.

Drugs and Renal Calculi

Q.—*What drugs in common use give rise to a risk of stone formation in the kidney in persons with normal renal function?*

A.—Drugs only rarely produce kidney stones. Those that do so do by altering calcium metabolism—for example, vitamin D—or by making the urine alkaline—for example, carbonic anhydrase inhibitors such as acetazolamide—or by modifying urate excretion—for example, the thiazide group of diuretics. Vitamin D is harmful in this way only when given in a high range of dosage, such as 1 to 5 mg. a day (40,000 to 200,000 i.u.). Doses of this magnitude are necessary in the treatment of hypoparathyroid tetany and for various forms of metabolic bone disease, but they should not be given for the prophylaxis of rickets, when doses of 10–100 µg. a day are adequate and harmless.[1] All forms of vitamin D, such as vitamin D_3 and dihydrotachysterol, introduce a similar danger.

With the danger from the vitamin D compounds should be considered the similar danger with all calcium salts, such as lactate, gluconate, and so forth, since large doses of these, sometimes given as ingredients of antacids, can produce renal calcification and stones even with normal renal function. The acetazolamide type of drugs may cause renal calcification, perhaps by reducing citrate output and alkalinizing the urine. They are commonly used only for glaucoma, but in this situation they may be essential and produce a therapeutic dilemma. A high fluid intake may be sufficient to prevent this complication.

Thiazide drugs act differently by virtue of their curious effect on uric acid metabolism. They frequently cause uric acid crystalluria with renal symptoms. I have known a large staghorn uric acid stone formed in a woman addicted to chlorothiazide, which irrationally she took to reduce her weight. High fluid intake and alkalinization with potassium salts, such as citrate or bicarbonate, are suitable methods of therapy when the drug cannot be changed for another diuretic not having this effect on uric acid.

We are not considering here the problem of urinary secretions from the crystallization of drugs, such as can occur with large doses of sulphonamides.

Treatment of Chronic Brucellosis

Q.—*What is the best treatment for long-standing brucellosis?*

A.—Tetracycline is still the sheet anchor in the treatment of long-standing brucellosis. Ampicillin, which, being a bactericidal agent, might be expected to be superior, failed when given in reasonable doses to two patients who subsequently responded promptly to tetracycline.[1] Spink,[2] from his extensive experience, recommends that tetracycline 0.5 g. should be given six-hourly for at least three weeks. It may be necessary to repeat this course once or twice, but treatment beyond that is not likely to be successful. Better results may be obtained if in addition streptomycin 0.5 g. is given twice a day intramuscularly for the first two weeks of treatment.

The Herxheimer-like reactions which may occur early in treatment can be controlled by prednisolone 15 mg. six-hourly intramuscularly, and this usually results in a prompt defervescence of symptoms.[3 4] It is also possible that corticosteroids affect the host-parasite relationship in some way which facilitates antibiotic activity. Combined tetracycline-streptomycin therapy with prednisolone for the first five days of treatment probably offers the greatest chance of eradicating the chronic disease.

Sterilizing Procaine Solution

Q.—*How should a procaine solution (2 or 3% in water) for injection be sterilized? Is steaming for 10 minutes sufficient?*

A.—The official pharmacopoeial method of sterilizing procaine hydrochloride injection is autoclaving at 115° C. (10 lb. per sq. in. (0.7 kg. per sq. cm.)) for 30 minutes. This method can be guaranteed to produce sterility, but it probably has a wide margin of safety. If this process cannot be carried out, steaming, preferably in the presence of a bactericide, could be used as an alternative.

Davis[1] stated about several injections, including procaine hydrocloride, that "even in the presence of contamination much worse than that obtaining during any dispensing operations, sterile products can readily be obtained by exposure to streaming steam at atmospheric pressure for one hour." He showed that a 2% procaine hydrochloride solution contaminated with a suspension of *B. subtilis* and *Cl. sporogenes* was sterile after 60 minutes' steaming. Briggs and Callow[2] showed that solutions of procaine hydrochloride have some bactericidal action on *B. typhosa* and *Streptococcus haemolyticus*, and that the effect is increased by chlorbutol and sodium metabisulphite.

If steaming were to be used it would be advisable to add 0.1% of chlorocresol, as in the official injection, and to continue the steaming for 30 minutes. That would probably give as wide a margin of safety as autoclaving. Ordinary pharmaceutical cleanliness should be observed in preparing the solution—for example, the utensils should be clean and should be rinsed with freshly distilled water. The solution should also be made with freshly distilled water and should be sealed and sterilized as soon as possible after preparation.

Worm Infestation in Dogs

Q.—*What treatment will eradicate roundworm and echinococcus infestation in dogs and thus eliminate the danger of these parasites being transmitted to children?*

A.—Tapeworms (including echinococcus) and roundworms (ascarids) are the most common helminths of dogs.

For routine purposes small oral doses of arecoline are effective against tapeworms, and one of the piperazine compounds or diethyl carbamazine citrate is indicated to combat roundworm infestation.[1 2] A periodic examination of the faeces will point out carrier animals. The elimination of external parasites by regular bathing with an insecticide will ensure freedom from the tapeworm *Dipylidium caninum*, since this tapeworm has both fleas and lice as its intermediate host.

Notes and Comments

"Arc Eye."—Dr. T. K. ELLIOTT (Sutton Coldfield) writes: Having had to deal with cases of "arc eye" for more than 20 years, may I be permitted to comment on the answer to this question ("Any Questions?" 26 August, p. 543)? While I would agree that adrenaline or, preferably, phenylephrine drops are usually effective for mild cases, more severe cases may require a preparation containing a local anaesthetic such as ½% pantocaine (amethocaine) eye ointment. Indeed, susceptible cases known to have been exposed to an overdose of ultraviolet light are, after initial treatment, usually given a tube of eye ointment to take home, because it is almost the only application which will prevent them having a sleepless night owing to intense pain in the eye.

Dr. M. W. ROBINSON (Chief Medical Officer, Associated Electrical Industries Limited, Power Group, Trafford Park, Manchester 17) writes: Out of a population at risk of approximately 2,000—that is, welders, fitters, and by-standers—our surgery attendances in this works number approximately 800 per annum. Some actually suffer "arc eye" (flash), and others are exposed to and fear the condition. All are treated immediately with adrenaline 1/4,000 eye drops, and are cured within 24 hours, except for a few—perhaps 10%—who require further treatment. They are given an astringent lotion, and they recover in a further 24 hours. This treatment is standard practice when electric-arc welding is carried out. Very rarely is a local anaesthetic required.

Clinicopathological Conference

A Case of Polycythaemia with Aortic Stenosis

DEMONSTRATED AT THE ROYAL POSTGRADUATE MEDICAL SCHOOL

Clinical History

Professor E. G. L. **Bywaters**: The patient (Case No. 205812, P.M. 11594), who was 61 at the time of his death, was first referred to the radiotherapy department of Hammersmith Hospital from Dr. Hollings of Kingston Hospital in 1957 with a diagnosis of polycythaemia rubra vera, having been investigated there for an epistaxis.

Examination showed a plethoric man with a rough systolic murmur over the aortic area radiating up to the neck. The blood pressure was 190/150 mm. Hg. The spleen and the liver were palpable, 2 and 4 cm. respectively beneath the costal margin. Investigations confirmed the polycythaemia, with a haemoglobin of 22.5 g./100 ml., packed cell volume 70%, red blood cells 8.3 million per cu. mm., platelets 350,000, white blood cells 13,000 per cu. mm. The differential count showed 90% neutrophils, 2% eosinophils, 6% lymphocytes, and 2% large monocytes. The blood volume was 8.7 l. (114 ml./kg.) and the red cell volume 5.6 l. (73 ml./kg.) body weight both increased from the upper limit of normal—85 to 35 ml./kg. respectively. The bone marrow showed hyperactivity and the E.C.G. showed left ventricular hypertrophy. These findings were thought to be consistent with a diagnosis of polycythaemia rubra vera and aortic stenosis, and the man was treated with 6 mc. ^{32}P.

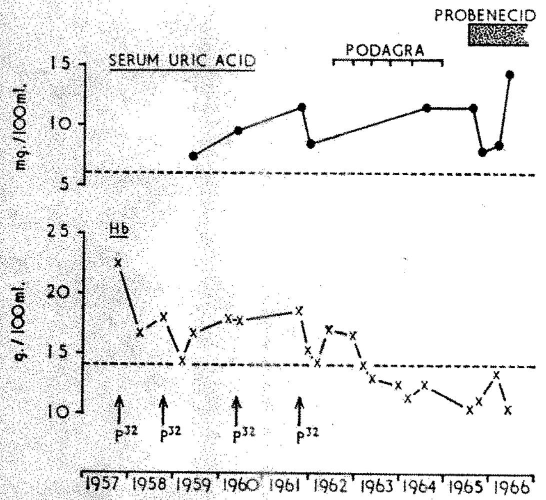

Chart showing progress of patient 1957–66.

In April 1958 he suffered an acute loss of consciousness followed by transient right-sided facial weakness and was admitted to St. Bartholomew's Hospital with a diagnosis of probable cerebral thrombosis. In November 1958 he was readmitted to Hammersmith Hospital. At that time there were no abnormal neurological findings, the liver and spleen were not palpable, the blood pressure was raised at 240/170 mm. Hg, and the chest *x*-ray showed left ventricular enlargement. The haemoglobin was 18 g./100 ml., the red blood cells 5.7 million per cu. mm., packed cell volume 54%, white blood cells 8,000 per cu. mm. with platelets 426,000 per cu. mm. In view of persistent signs of polycythaemia he was given a further injection of ^{32}P (8 mc.). In 1959 he was readmitted again (third admission) for check-up, but the blood volume this time was relatively normal—6.1 litres (73 ml./kg.), as was the red blood cell volume—2.7 l. (32 ml./kg.), haemoglobin 16.6 g./100 ml., packed cell volume 48%. The uric acid at this time was found to be raised at 7.7 mg./100 ml., and blood urea 42 mg./100 ml.

In 1960 he had become increasingly plethoric and was admitted for the fourth time. The liver and spleen were no longer palpable, haemoglobin 17.8 g./100 ml., packed cell volume 53%, and serum uric acid still raised at 9.5 mg./100 ml. He was given a further dose of ^{32}P (5.9 mc.).

The next year, 1961, he was admitted for the fifth time, at this moment being symptom-free. The blood pressure had come down to 170/110 mm. Hg, there was an aortic systolic murmur and the heart was not thought to be enlarged. The haemoglobin was 18.4 g./100 ml., packed cell volume 55%, serum uric acid 11.6 mg./100 ml., with urea 46 mg./100 ml. He was given a fourth and final injection of ^{32}P (6 mc.).

Onset of Gout

The next year he developed gout, and in the ensuing two years suffered six attacks of typical podagra responding to colchicine. In 1963 he had a grand mal attack treated with phenobarbitone, and in 1964 was referred to the rheumatology unit.

At this time, seven years after his original admission, he was relatively well, with a blood pressure of 160/105 mm. Hg. The liver and spleen were both palpable at 4 and 10 cm. from the costal margin respectively, and a loud systolic murmur was heard in the aortic area. Small lumps were found on the ears, but crystals were not obtained from these on puncture. The serum uric acid before treatment was found to be 12 mg./100 ml., with a haemoglobin of 12.4 g./100 ml. and a urea of 49 mg./100 ml. Before he could be started on uricosuric therapy he went off to South Africa for a holiday for three months, and we saw him again only on his return, when he was admitted again in July 1965 (for the sixth time). This time he had developed heart failure, and was complaining of dyspnoea and ankle swelling. Examination showed him to be cyanosed, plethoric, and dyspnoeic, with basal râles and oedema of the legs. The jugular venous pressure was elevated to 10 cm., there was a mid-systolic murmur loudest in the fourth left interspace, and the apex beat was outside the midclavicular line in the sixth space. The pulse was 120, the blood pressure 110/60 mm. Hg., and there was a triple rhythm. The liver was enlarged to 10 cm. below the costal margin and the spleen to 3 cm. There was no evidence of arthropathy or tophus formation. Chest *x*-ray revealed cardiomegaly and interstitial pulmonary oedema ; the E.C.G. showed left ventricular hypertrophy. The blood urea was 60 mg./100 ml., the serum uric acid 11.6 mg./100 ml. Blood cultures were negative. The

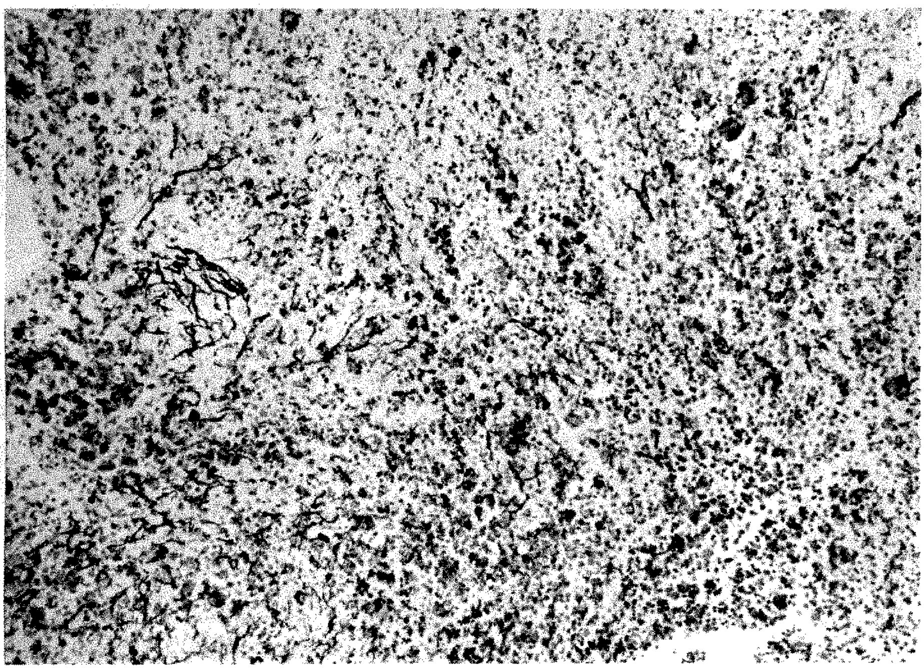

FIG. 1.—Vertebral bone marrow. Hypercellular marrow with scanty reticulin fibres. (Reticulin stain. ×115.)

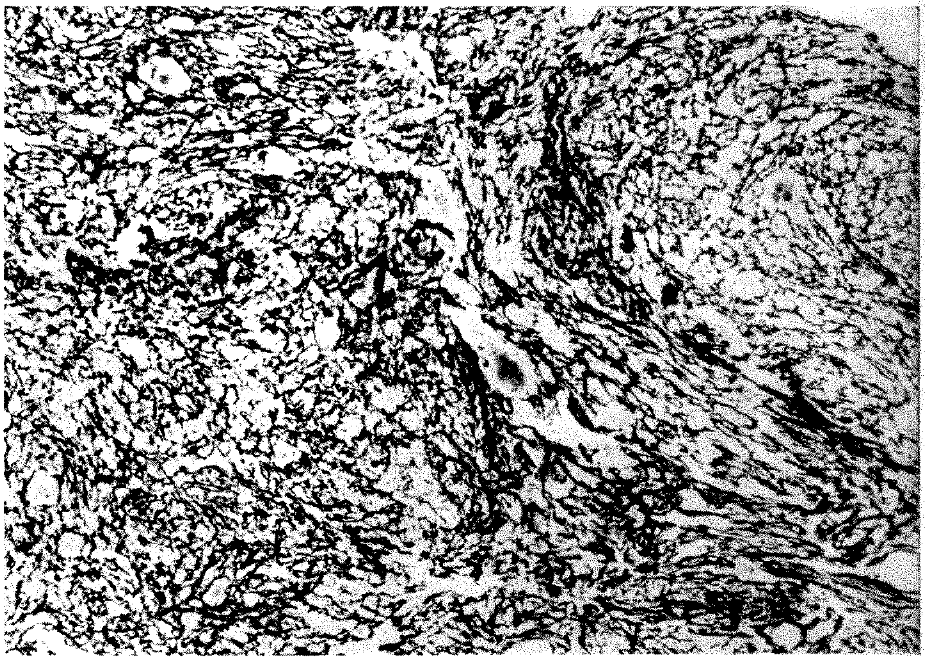
FIG. 2.—Femoral bone marrow. Markedly increased reticulin fibres with parallel coarse fibres. Cells are unstained. (Reticulin stain. ×115.)



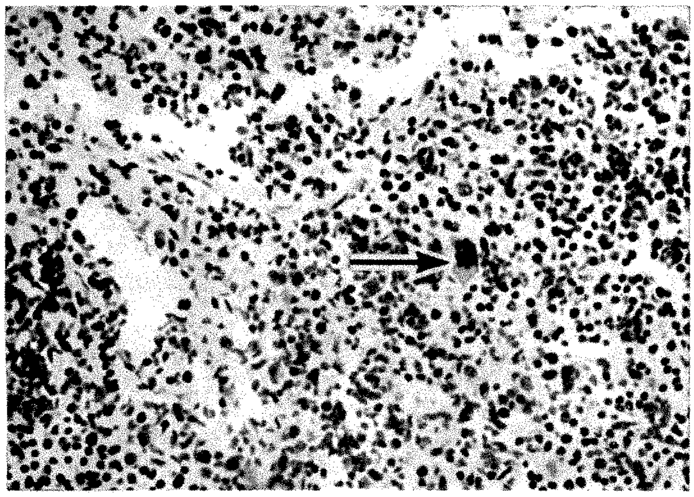


FIG. 3.—Lymph node. A cell of the megakaryocyte series (arrowed) lies near a lymph follicle. (H. and E. ×270.)

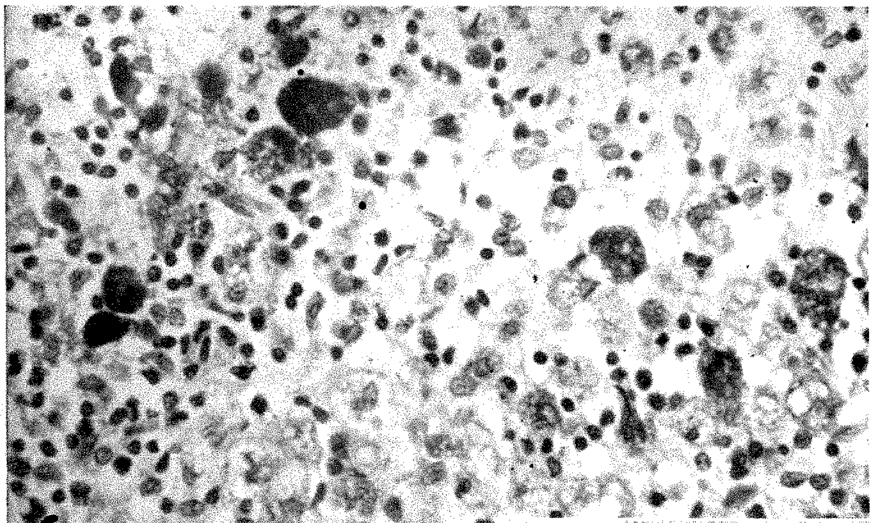

FIG. 4.—Splenic pulp. Many cells with foamy cytoplasm; in some this is strongly P.A.S. positive. (P.A.S. ×430.)

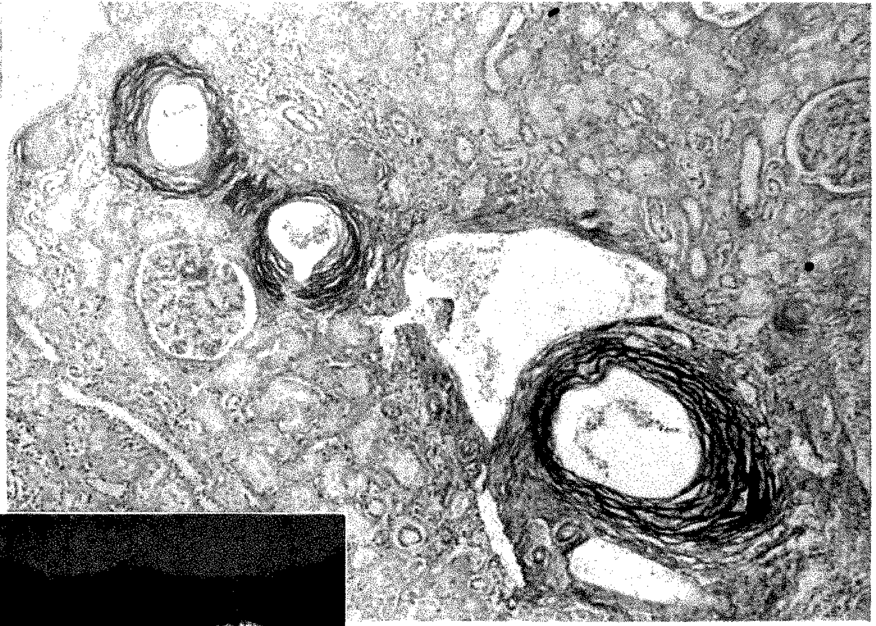

FIG. 5.—Kidney. Elastic reduplication. This may be a senile change or due to hypertension. (Elastic van Gieson. ×430.)

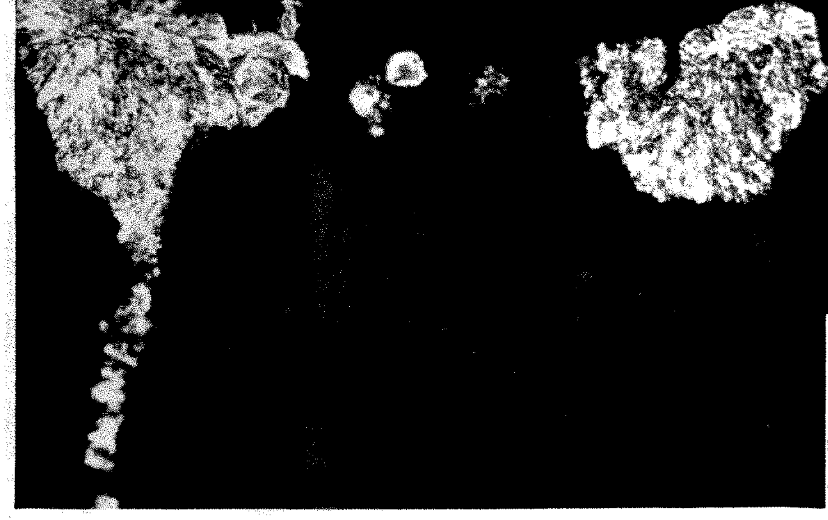

FIG. 6.—Cartilage. Birefringent urate deposits photographed with partly crossed polaroids.

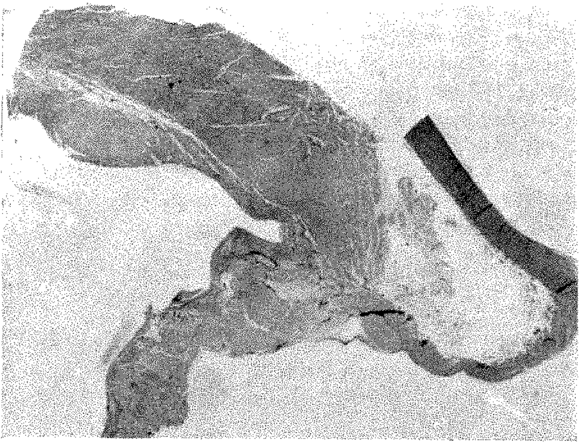

FIG. 7.—Aortic valve. Grossly thickened calcified cusp of aortic valve. (H. and E. ×3.25.)

haemoglobin was 10.2 g./100 ml., and the red blood cells 3.8 million per cu. mm. The packed cell volume was 32%, white blood cells 22,000 per cu. mm. with 98% neutrophils and platelets 155,000. The red cell volume was 2.3 l. (34 ml./kg.) plasma volume 4.2 l. (34 ml./kg.), plasma volume 4.2 l. (62 ml./per kg.), the latter being slightly raised, presumably due to his heart failure, the total blood volume therefore being 6.5 l. (97 ml./kg.).

Renal function was at this time relatively good, with a concentration and dilution of urine between 1010–1019 specific gravity. The mean uric acid excretion for 24 hours in the urine was 670 mg. The plasma iron clearance, using ^{52}Fe, showed 39.5 minutes (normal 70–140 minutes)—that is, an increased clearance. Surface counting over the screen gave no evidence of extramedullary erythropoeisis. A bone marrow biopsy showed marked hyperplasia of all elements, with slight megaloblastic change and low iron stores.

Onset of Heart Failure

At this point, therefore, though the polycythaemia had been brought under control by the phosphorus injections as shown by a relatively normal red blood cell volume, he had developed cardiac failure, and this was the major clinical problem. We were uncertain of the cause of the failure but thought it to be due to a combination of aortic stenosis, hypertension, and ischaemic heart disease. Treatment with digitalis and mersalyl produced some improvement despite a transient attack of atrial flutter with 2:1 block. Blood volume studies gave no reason for further treatment of his polycythaemia. While he was in the ward another grand mal attack occurred, presumably due to cerebral thrombosis. An electroencephalogram showed minimal left-sided abnormality.

He was discharged and remained free from cardiac failure and of attacks of gout on treatment with probenecid as a uricosuric drug and colchicine although the serum uric acid did not fall below 7.9 mg.%.

Last Admission

However, in 1966 he was readmitted for the seventh and last time in severe congestive cardiac failure. The pulse was irregular at an apical rate of 100 beats per minute, with extra-systoles. The blood pressure was 110/70 mm. Hg., the jugular veins were congested to the angle of the jaw and showed cannon waves. Sacral and leg oedema was present, the spleen and the liver were enlarged, the haemoglobin was 10.4 g./100 ml., white blood count 18,000 per cu. mm. with 90% neutrophils, and the packed cell volume 33%. The electrocardiogram showed ventricular extra-systoles, the blood urea was 85 mg./100 ml., the serum uric acid 14.4 mg./100 ml., and the serum potassium 4.8 mN/l.

He was treated with bed rest, low salt intake, digoxin, frusemide and continued probenecid, with added potassium tartrate. Five days after admission supraventricular tachycardia occurred, not correctable by intravenous injections of lignocaine. Direct current shock under general anaesthesia restored sinus rhythm but later the same day he developed cardiac arrest and resuscitative measures were unsuccessful.

Clinical Diagnosis

(1) Polycythaemia rubra vera (successfully treated); (2) secondary gout (treated, but with poor success as regards serum uric acid levels); (3) congestive cardiac failure, due mainly to aortic stenosis.

Haematology

Dr. S. M. LEWIS: We know that in a significant number of patients with polycythaemia the condition eventually progresses to myelosclerosis. We know that this is not a sudden process, it is a gradual change; the patient doesn't have polycythaemia one day and myelosclerosis the next day. In this case there was a gradually developing anaemia, the spleen began to enlarge, so that by 1965 there was no doubt that he had evidence of early myelosclerosis although not yet the full-blown picture. A peripheral blood film in 1965 showed a red cell appearance significantly different from earlier films. Oval poikilocytes were present—the sort of poikilocytes which begin to make an appearance at an early stage of myelosclerosis. Haematologically at least there was no doubt about the development of myelosclerosis.

Professor C. C. BOOTH: Could I ask you one question—were there any macrocytes or multilobe polymorphs in that last film?

Dr. LEWIS: There were no multilobe polymorphs. Had there been, I would not have been surprised. There were some sideroblasts present in the bone marrow at the late stage—an interesting complication. There were certainly macrocytes; some of them were polychromatic macrocytes, indicative of a high reticulocyte count, and there were possibly minimal changes of megaloblastic anaemia as well.

Post-mortem Findings

Dr. D. EVANS: The body was that of an elderly male of normal nutrition, with central cyanosis. There were bilateral inguinal herniae. The seventh rib was fractured.

The *spleen* (1,800 g.) was firm with a dark red pulp, inconspicuous Malpighian follicles, and scattered grey-white nodules 2–6 mm. in size with ill-defined outlines. There was soft red marrow in the shaft of the whole of the right femur. There was no lymphadenopathy.

The *heart* (690 g.) showed left ventricular hypertrophy (2.1 cm.). The aortic valve was bicuspid, with heavily calcified irregular rigid cusps forming a slit-like opening 2.3 cm. long. The tricuspid valve was 14.0 cm. in circumference; the other valves were normal. There was non-occlusive coronary artery atheroma.

The *lungs* were oedematous. The liver (2,700 g.) had a nutmeg appearance.

The *kidneys* were of equal size (150 g.) and had finely nodular subcapsular surfaces.

There was white frosting over the articular cartilage in the right metatarsophalangeal joint, but none in the hips or knees.

On microscopy the *marrow* (Fig. 1) was cellular, with normal erythropoietic components. The reticulin pattern was variable, ranging from normal through increased to "fibroblastic" (Fig. 2).

Extra medullary haemopoiesis was present, as evidenced by megakaryocytes in the liver, spleen, and lymph nodes (Fig. 3) but quantitatively it was slight.

Foamy phagocytes were present in the spleen (Fig. 4), some showing P.A.S. positive cytoplasm. The kidneys showed non-specific scars and marked elastosis of the intralobular arteries consistent with but not diagnostic of benign hypertension (Fig. 5). Doubly refractile urate crystal deposits could be shown in cartilage (Fig. 6). Calcific aortic stenosis was confirmed (Fig. 7), and interstitial myocardial fibrosis was present. There were heart failure cells in the lungs.

So this patient had suffered from polycythaemia rubra vera with secondary hyperuricaemia leading to clinical gout. Following repeated treatments with radioactive phosphorus the polycythaemia became controlled but evidence for progression of the disease into a myelosclerotic phase was equivocal. The aetiology of his cardiac failure was a combination of hypertension and aortic stenosis, the latter occurring on the basis of a congenital bicuspid aortic valve which became calcified later in life.

Pathologist's Diagnosis

(1) Polycythaemia rubra vera.
(2) Secondary gout.
(3) Calcific aortic stenosis on congenitally bicuspid valve.
(4) Congestive heart failure.
(5) ? Benign hypertension.

Discussion

Professor BYWATERS: The several problems here fall fairly clearly into three or four different categories. I think we might discuss first of all whether there was myelosclerosis present or not, and what we could expect to see if there were.

Dr. LEWIS: The point against myelosclerosis was, as Professor Bywaters remarked, that there was little evidence of extramedullary haemopoiesis as measured by surface counts after injection of radioactive iron. But we found at necropsy that there was evidence of some extramedullary haemopoiesis. It is my impression that a significant degree of extramedullary haemopoiesis does not usually occur in uncomplicated polycythaemia vera, and when it does occur this is evidence in favour of myelosclerosis. Plasma iron clearance was particularly rapid, but we don't know what the patient's red cell survival rate was, and I do not think that the observation of rapid plasma iron clearance helps to distinguish myelosclerosis from polycythaemia.

Dr. C. L. COPE: Could you explain what plasma iron clearance is—I don't think everybody's quite clear.

Dr. LEWIS: Plasma iron clearance is the time taken for a small dose of intravenously administered radioactive iron to disappear from the circulation. Normally it goes to the bone marrow, where it will be utilized for the production of further red cells or kept there as part of iron stores. Essentially it is a reflection of erythropoietic activity. It is more rapid than normal in polycythaemia. In myelosclerosis it is sometimes slower than normal but in other cases of myelosclerosis it may be rapid.

Professor BOOTH: May I just interrupt here—I'm getting totally confused. The issue seems to be, had this patient what you term uncomplicated polycythaemia rubra vera or had he myelosclerosis ? What we need to know is what criteria you would use to differentiate between these two.

Dr. LEWIS: As I said earlier the distinction is very difficult at the stage of the disease where it is in transition. Undoubtedly the patient initially had polycythaemia. He had a high red cell count with a very high red cell volume and a polymorph leucocytosis but relatively few metamyelocytes and no myelocytes in circulation ; and his spleen was not palpable. These are the features of polycythaemia vera. On the other hand the peripheral blood film showed poikilocytosis, which is a striking feature of myelosclerosis and is a reflection of marrow abnormality.

Features of Myelosclerosis

Professor BOOTH: In other words there are two main features of myelosclerosis ; one, the anatomical abnormality within the bone marrow, namely fibrosis with an increased reticulin pattern, and the other a functional abnormality of some sort seen in the peripheral blood. Dealing with the anatomical abnormality, does Dr. Evans think it was present ?

Dr. EVANS: I find it almost as difficult as Dr. Lewis does. I can't agree about the absence of extramedullary haemopoiesis in uncomplicated polycythaemia rubra vera. Minot in 1923[1] recognized that a severe degree may sometimes occur. In our cases of polycythaemia rubra vera the amount of extramedullary haemopoiesis I found here is present in every one. In other words, one finds histological evidence of extramedullary haemopoiesis in polycythaemia rubra vera even if it is functionally unimportant.

Professor BOOTH: In fact, then, the degree of reticulin pattern that you showed us in those very beautiful pictures could be found in a patient with uncomplicated polycythaemia.

Dr. EVANS: It has been shown to occur not only in patients with polycythaemia rubra vera but also in patients with other conditions.[2] Chronic myeloid leukaemia and even blast cell leukaemias can show a fibroblastic type of pattern. I don't think it is specific.

Dr. LEWIS: But it is a matter of degree.

Dr. EVANS: Partly.

Professor BOOTH: Dr. Wheby, would you like to give us the American view on this.

Dr. M. S. WHEBY: I can't give the American view but I can give my own view. There is no good way to resolve the issue —it is a problem in semantics. This points to the convenience of the concept of a "myeloproliferative syndrome."

Effect of ^{32}P

Dr. EVANS: May I ask whether any of these changes he has may be related to the ^{32}P treatment ?

Professor BYWATERS: What would Dr. Lewis expect this fairly successful ^{32}P treatment to produce ?

Dr. LEWIS: No changes in the red cell morphology, which remains normal. That is, if one is assuming that the ^{32}P treatment itself is not influencing the development of myelosclerosis.

Dr. CELIA OAKLEY: I am not quite clear why he was anaemic. If it was due to the ^{32}P, why did he still have extramedullary haemopoiesis ? He had a funny-looking blood film and calcific aortic stenosis—was there any evidence of mechanical intravascular haemolysis in that film ?

Dr. LEWIS: He had polychromasia and a reticulocyte count of 9% at one stage.

Professor BOOTH: Unless the red cell turnover was measured you can't really answer this.

Dr. LEWIS: I do not have any record of a red cell survival study. The presence of polychromasia might suggest that there was an increased red cell destruction. Alternatively, it could equally well be due to extramedullary haemopoiesis.

Professor BOOTH: The other question I wanted to ask was whether there was any megaloblastic change at the end. You suggested there were some intermediate megaloblasts in the bone marrow. Now this is a very interesting point, because if polycythaemia in its uncomplicated phase is compared with myelofibrosis the polycythaemic patient doesn't usually develop folic acid deficiency. The patient with myelofibrosis very frequently has a low serum folate and may develop frank megaloblastosis with an anaemia that can then respond to folic acid. In other words, there is an actively turning over marrow in myelofibrosis which can, as in haemolytic anaemia, induce a folic acid deficiency. Did you have any folate studies ?

Dr. LEWIS: I have no record of one.

Professor BYWATERS: I wonder if we could ask Dr. Evans whether there was much evidence of continuing haemolysis. The suggestion Dr. Oakley made was a very good one: I don't think we looked at haptoglobins in his plasma at all.

Dr. EVANS: Iron stains on the liver and spleen were negative.

Professor BYWATERS: So there is really little evidence for continuing haemolysis and the verdict on the myelosclerosis is that there might have been a little bit of it.

Dr. LEWIS: Yes, I think this is well put, and in fact, had this patient survived, there is evidence, I think, that he might have gone on to develop a much more clear-cut myelosclerosis.

Gout

Professor BYWATERS: I think perhaps the next point is this man's gout; it was an expected phenomenon and it behaved properly; the only thing that didn't go according to expectation were his serum uric acid levels which treatment with probenecid didn't reduce to normal, as it should do; because of this we were considering starting him on allopurinol, but we didn't get round to it because of his heart failure. I think, therefore, that the failure of probenecid was probably due to the slight renal functional impairment and this again was probably related to the fibrosis associated with the changes of essential hypertension. The kidneys, however, were not decreased in size.

Dr. EVANS: The only abnormal feature of the kidneys was the presence of the small scars.

Dr. E. D. WILLIAMS: Could I ask whether the development of gout can be correlated with the severity of the polycythaemia, or whether there is a great individual variation suggesting maybe an inherited predisposition to gout?

Professor BYWATERS: There is a good direct relationship of packed cell volume to serum uric acid level if only those polycythaemic patients who have a good renal function are considered; if renal function is impaired, rather erratic increases in serum uric acid occur which do not correlate so well with packed cell volume.

Dr. WILLIAMS: What about the development of clinical gout?

Professor BYWATERS: Clinical gout is an accident that frequently occurs in patients who have high levels of serum uric acid due to increased formation of urate and/or due to decreased output; that is with a body pool of urate increased from the normal level of one gramme of urate up to five, ten, or twenty grammes. We didn't measure this man's body pool, but we have every belief that it was increased and that his turnover was increased, as it is in all these patients. But there is no specific hereditary gouty tendency in this type of secondary gout, which is rare compared with primary gout: furthermore there is no predilection for males as there is in primary gout.

Professor BOOTH: And presumably there is no family history either.

Professor BYWATERS: There was no family history.

Dr. LEWIS: There was a review by Lynch about four years ago[3] on uric acid levels in blood dyscrasias and he suggested that in polycythaemia—pure uncomplicated polycythaemia—uric acid levels were generally lower than the levels in what he termed myeloid metaplasia, which undoubtedly included early myelosclerosis.

Professor BYWATERS: I think it depends upon the amount of purine turnover that's going on.

Dr. LEWIS: The point that Lynch made was that in polycythaemia the factor causing the elevation of uric acid is an increased number of red cells in circulation. In myeloid metaplasia on the other hand there may be considerable destruction of haemopoietic cells at the sites of extramedullary haemopoiesis, cells which are never delivered into circulation.

Professor BOOTH: And when a patient develops myelofibrosis does the gout get better?

Professor BYWATERS: I don't think we have any information on that point—in general I think it is a later stage in the disease and the gout will tend, therefore, to be worse because there is likely to be some renal impairment.

Professor BOOTH: Was there any evidence of gouty infiltration of the kidney?

Dr. EVANS: No, we fixed the kidney in alcohol and examined sections under polaroids, but there were no urate or uric acid deposits there. I don't think the mechanism by which gout affects the kidneys is known. The type of scar present here is non-specific though seen quite frequently in patients with gout.

Professor BYWATERS: It is the usual type of gouty kidney; whether it's related to the gout or not I don't know, but only a comparatively few cases show tophi in the kidney. Tophi in the kidney are thought to be much more important and more frequent than they really are. I think you're quite right that the real lesion in the typical case of gout with renal impairment is fibrosis.

Heart Failure

Professor J. GOODWIN: If I may, I would like to ask the pathologist about essential hypertension. You were obviously a little hesitant about diagnosing this, and since the patient had two diseases known to be associated with hypertension—gout and polycythaemia—I wonder if you would like to comment on that point and the possible other causes for his hypertension. There are, however, just two cardiac points I would make. One is, as Dr. Oakley said, this obviously wasn't a digitalis arrhythmia because the patient went back to sinus rhythm. Now if there is a digitalis tachycardia, as she's pointed out, very commonly the patient either won't revert to sinus rhythm with counter shock, or—much worse—he will develop serious conduction defects, heart block or even asystole. So counter shock, which is a very valuable means of treating resistant arrhythmias, is largely contraindicated in a patient with an unquestioned arrhythmia due to digitalis. I think the response of the patient to counter shock shows that this definitely was not a digitalis arrhythmia despite the fact that the cardiogram showed quite a lot of digitalis effect, much more, in fact, than it had on the previous occasion.

The other point I would like to make is a very small one, and that is that one is realizing more and more as time goes by that isolated calcified aortic stenosis commonly has a congenital aetiology; the lesion is not rheumatic or degenerative, as has often been thought in the past. This is still, I think, not always appreciated, and if I'd been a little brighter when I saw him first I might have diagnosed *congenital* aortic stenosis, but we were preoccupied with other factors. I think everything fits in. I'm a little surprised that he didn't have ischaemic heart disease due to coronary occlusion in view of the gout, polycythaemia, hypertension, and the fall in his blood pressure, which hasn't really been adequately explained but might have been due to myocardial infarction. His heart failure could be explained on the basis of the aortic stenosis, for as the valve becomes more heavily calcified so it becomes more rigid and thus the effective orifice becomes reduced. Together with an ageing myocardium I think probably there was quite enough to account for the heart failure.

Professor BOOTH: Dr. Evans, what about the hypertension?

Dr. EVANS: One of the criteria, left ventricular hypertrophy, is obviously invalid in the presence of aortic valve disease. Diagnosis depends then on what one's assessment is of the state of the small vessels, particularly in the kidney. Here we have an elderly man, and elderly people get a senile elastosis of the small vessels in the kidney with some elastic duplication. My own feeling was that this was rather more severe than I expected, and this is possible evidence that he did have a benign hypertension, but it's purely a question of opinion on the quantitative significance of the changes.

Professor BOOTH: Dr. Wheby reminded me that hypertension and polycythaemia go under the heading of Gaisböck's syndrome—what about this?

Dr. EVANS: I think the polycythaemia there is not polycythaemia rubra vera, is it?

Dr. LEWIS: As far as I am concerned it really is rather meaningless, but the name has been applied to this combination. A group of these patients studied at Johns Hopkins were found to have so-called "stress" polycythaemia or relative polycythaemia related to a shrinkage of plasma volume. But, in fact, approximately 30% of patients with polycythaemia do have hypertension.

Blood Volume

Dr. OAKLEY: May I offer an alternative explanation for the drop in blood pressure? There is a third contributor to the blood "pressure" which is often not spoken about very much and that is the blood volume. When he was polycythaemic he had an increased circulating blood volume—when the polycythaemia was subsequently treated his blood pressure fell and blood volume studies were then repeated and the comment made that no further treatment was needed. This was because the blood volume had fallen to normal, and with it his blood pressure, and perhaps this is the best explanation for the loss of his hypertension.

Professor BYWATERS: The high viscosity of the blood in polycythaemia increases the work of the heart.

Professor R. STEINER: I don't think we can accept this story of aortic stenosis becoming severe in the last few weeks or months. In retrospect when we looked at his old films it was realized that he had calcific aortic stenosis in 1958.

Professor GOODWIN: But you can't quantitate it, can you?

Professor STEINER: No.

Dr. A. BRECKENRIDGE: There is another relationship—we showed that approximately 30% of patients with untreated hypertension had a raised uric acid, but of course these were not the patients that over-produce uric acid—they're the ones that under-excrete it.[4] I think this is another facet to this very complicated problem.

Professor BOOTH: So if he'd had essential hypertension in addition to everything else this would have encouraged the retention of uric acid too. The other thing that interested me was the intensity of the fibrosis of the myocardium in a patient with apparently patent coronary arteries.

Dr. EVANS: This type of fine fibrosis lying in between the muscle fibres one tends to find with severe hypertrophy of the left ventricle, particularly when there is an associated aortic valve stenosis.

Professor BOOTH: So that your diagnosis of hypertension, ischaemic heart disease, plus aortic stenosis is all quite correct.

Dr. OAKLEY: All patients with severe aortic stenosis have ischaemic heart disease (but not necessarily coronary artery disease).

Dr. BRECKENRIDGE: In recent surveys it has been shown that patients with a raised uric acid have an increased incidence of ischaemic heart disease.

Professor BOOTH: Thank you. Any other points?

Professor GOODWIN: Can hyperuricaemia account for the myocardial fibrosis?

Dr. EVANS: I don't know in this particular instance whether there was any uric acid in the heart.

Professor BYWATERS: It would not produce a generalized fibrosis. Certainly tophi have been described in the mitral valve—this is quite likely to occur—it might possibly be found that crystals are present because of the calcific fibrosis, but I don't think it contributes anything.

Professor BOOTH: And really we have quite enough to explain it already. Thank you all.

We are grateful to Professor J. P. Shillingford and Dr. E. D. Williams for assistance in preparing this report, and to Mr. W. Brackenbury for the photomicrographs.

NEW APPLIANCES

Substitute for Gauze Swabs during Surgery: Preliminary Report

Mr. I. G. SCHRAIBMAN, Western Infirmary, Glasgow, writes: Most surgeons will be familiar with the numbing fear experienced when the scrub nurse, after some minutes of increasingly frenzied burrowing among the drapes, announces that the operative and postoperative swab counts do not tally. This may result in prolongation of the anaesthetic, disruption of theatre and radiology department schedules, and at very least the generation of considerable warmth in the theatre. If the error passes unremarked, the surgeon may well be accorded the distinction of appearing anonymously in the annual review of one of the medical defence societies.

The human factor can never be eliminated, and the risk will remain so long as obscuring fluids have to be mopped from the operative field.

It seemed reasonable to suppose that the risk could be lessened if the number of objects to be counted was limited; but as gauze swabs can be used only once the number used (and therefore the risk) is in proportion to the bloodiness of the procedure. For the number of swabs to be limited, therefore, they would have to be reusable, and in line with current post-mortem practice it was decided to use polyurethane sponges instead of swabs.

Ordinary commercial polyurethane foam sponge was purchased and cut with a sharp knife to the required size. The actual sizes selected were arbitrary—namely, 6 by 4 by 1½ in., 4 by 2 by 1½ in., and 2 by 2 by 1 in. (15 by 10 by 3.8 cm., 10 by 5 by 3.8 cm., and 5 by 5 by 2.5 cm.). Three of the first and six each of the latter were used for a major operation—for example, gastrectomy or colectomy—but only the two smaller sizes for smaller procedures—for example, hernias and varicose veins. For potentially infected operations—for example, where the bowel was to be opened—two separate sets of sponges were used, the contaminated ones being removed together with contaminated instruments and drapes, when the dirty part of the procedure was completed.

The sponges were wrapped in paper packets and sterilized by a standard theatre autoclaving procedure. Before use samples of the centre of some sponges were cultured but revealed no growth.

The absorptive capacity was increased by prior wetting of the sponge with saline. When the sponge was full of blood it was wrung into a measuring jug kept solely to register blood loss. It was then rinsed in normal saline and wrung out again ready for use. Sponges could be autoclaved four to six times before irreparably losing their shape and fluid-holding capacity.

It is now planned to impregnate the sponges with a radioactive substance for *x*-ray visualization.

Sponges were used in 19 major and 23 minor procedures without untoward effects. There were no unexpected wound infections and no sponges were lost. The only situation in which the gauze swab was to be preferred was for friction dissection, mounted on a forceps, as sponges would tear.

Polyurethane sponges have three advantages over gauze swabs: (1) as they are reusable a finite and limited number of them is required, regardless of the length or bloodiness of the operation; (2) a reasonably accurate running total of blood loss can be kept; and (3) commercially made sponges may be marketed at about half the price of gauze swabs on a unit for unit basis. The cost decreases with each reautoclaving, and, of course, the do-it-yourself variety come cheaper.

Book Reviews

Facts on New Growths

Prevention of Cancer: Pointers from Epidemiology. The Rock Carling Fellowship, 1967. By Richard Doll, O.B.E., D.Sc., M.D., F.R.C.P., F.R.S. (Pp. 143; illustrated. 7s. 6d.) London: Nuffield Provincial Hospitals Trust. 1967.

At the front of this book we are told that "The Rock Carling Fellowship was founded as an annual memorial to the late Sir Ernest Rock Carling," and once a year a book comes out to help us to keep in mind the life and works of this great man. This year the man of choice to write the book was W. R. S. Doll, and he has done his task well.

He has put down a lot of sound sense on that group of ills which we call new growths. The work is not, as some books have been, just a list of things that can cause lumps and bumps in rats and mice. To start with, Doll tells us the sort of facts that we should seek when we want to know if some forms of new growth are due to the air we breathe, the soil we dwell on, our food and drink, how we make love, the weed that some of us smoke, or what we use in our work. He then goes on to tell us how we should judge the facts that we have found and what they mean. He points out that in the long run the best proof may come from what takes place when we stop the use of a thing or change our way of life. To show this, he cites the case of a group of men, a lot of whom used to smoke; more of these men, in view of what they heard or read, had the good sense to give it up (or change to a pipe) than the rest of the men in the land. It may well be that the man in the street did not have the same chance to learn the true facts of the case. As time went by, it was found that the first group of men were, year by year, less prone to die from new growths in their lungs; while in the rest the rates for such deaths went up and up. This seemed to Doll to be fresh proof that new growths of the lungs can be caused by what men smoke.

Doll then lists some facts which may lead us to think that quite a few types of new growth can be due to things in the world round us, and he tells us how we can get rid of some of them and keep some in check. He does not want to ban those which do us more good than harm. He warns us that no dose of these things is so small that we can be sure that it is quite safe.

There are tests by which we can find out that a man has a new growth as soon as its strange cells start to grow and are shed. Doll tries to make us think out how we can tell if these tests will in fact help to save lives, or at least spare men pain and grief in the last part of their lives.

At the back of the book are six good maps, drawn in a new and clear way by Miss P. Cook, which show that the rates at which some kinds of new growths are found are not the same in all parts of the world, and that the change from place to place may be quite large.

To sum up in a few brief words, one would have to go a long way to find a book which was as well worth its price as this one, and most of us would gain if we were to read it.

I will now tell you why I have set out my views on Doll's book in such a strange style, which I hope he will not mind. At much the same time as I was asked to write this piece I had read, in proof, a new book[1] by an old friend, all in words with but one beat in them. I was struck by the fact that it helped me to make my thoughts more clear when, in turn, I tried to write in this way. Though, of course, I would not say that one should print one's work in this form at all times, I think it might help more men who write if they were to try it, too, at the stage when they set out their thoughts for the first time.

Facets of Radiotherapy

Modern Trends in Radiotherapy 1. Edited by Thomas J. Deeley, M.B., Ch.B., F.F.R., D.M.R.T. and Constance A. P. Wood, M.A., M.R.C.P., F.F.R. (Pp. 382+xiii; illustrated. 85s.) London: Butterworth. 1967.

The only way a practising physician today can keep abreast of the times is to attend scientific meetings and read the medical literature. The latter is so enormous that the problem of selecting what to read depends upon interest and knowledge, as well as the ability to select, to skim, and to avoid.

In this book Dr. Deeley and Dr. Constance Wood have invited experts in the many facets of radiotherapy to record their own particular experience. There are 44 pages of references, mainly to articles written by the contributors. The book thus winnows the literature for our benefit. The first six chapters discuss the fundamental applications of radiobiology, including fractionation, oxygen, and combined therapy using chemotherapeutic agents. The next four chapters discuss boron capture therapy, fast neutron therapy, and Professor J. S. Mitchell's researches on the use of tritium-labelled compounds. Then Dr. Deeley pauses and inserts his own chapter on controlled clinical trials, and I assume that its insertion here is deliberate. It is chapter 11 in the centre of the book—the fulcrum, keeping the balance and reminding us that the true objective of all this is greater success, scientifically assessed, in the treatment of disease.

Dr. E. C. Easson writes on the management of Hodgkin's disease and allied diseases, and Dr. D. A. G. Galton a fascinating and instructive chapter on trends in the therapy of leukaemia, which is hardly a trend in radiotherapy. Similarly, the last chapter on the detection of tumours using isotopes does not absolutely fulfil the qualification of radiotherapy, which is the treatment of disease by ionizing radiation. The therapeutic use of radioiodine and radiophosphorus is of concern to the radiotherapist, but the chapter on pituitary implantation by G. F. Joplin and M. Hartog concerns only endocrine diseases which are highly specialized, and no mention is made of its value in the treatment of advanced carcinoma of the breast, which is a daily problem for the radiotherapist. One notable omission in the book is an account of the indications for the use of remote loading devices, which can be of tremendous value from the point of view of protection, provided the fractionation is radiobiologically effective. It is important that a technique should not be pigeon-holed too closely as a trend in a physiological exercise of wide applicability but limited interest.

It is interesting that the chapters on chemotherapy, boron capture, telecurie apparatus, electron therapy, and heavy particles all come from abroad, and, while it is interesting to learn what our colleagues are doing, it is unlikely that the facilities will be available in this country on any scale unless private means are available for buying the expensive apparatus involved. This does not minimize the contribution to knowledge which work with various particles provides, particles whose elementary life period appears very short as new ones are detected and marshalled.

The book is an attempt to relate progress through a vast field, and, while improvements in clinical results are not commensurate with technical advances, scientific accuracy of application of these irradiations does eliminate one complicating factor in our studies. The hope of the future must lie with greater knowledge of the relationship of dose to effect, which is a problem of fundamental radiobiology. The book makes fascinating reading and must be studied by all who are concerned with radiotherapy or radiobiology.

I. G. WILLIAMS.

Physiology as the Basis of Surgery

Scientific Foundations of Surgery. Edited by Charles Wells, C.B.E., S.Pk., F.R.C.S., Hon. LL.D., and James Kyle, M.Ch., M.B., F.R.C.S., F.R.C.S.I. (Pp. 629+xix; illustrated. £6 6s.) London: William Heinemann. 1967.

Not long ago a book entitled *The Scientific Foundations of Surgery* might have been expected to include a great deal of regional anatomy and some descriptive pathology but little else. By contrast this impressive volume consists almost entirely of physiology and the undefined territory which lies between general pathology, biochemistry, and cell biology. Moreover it comprises not merely the clinical applications (though these are not neglected) but also in generous measure the fundamentals of these sciences.

Thus, the first chapter deals at some length with the basic physiology of the heart, the mechanism of the coronary circulation, the control of blood pressure, the methods of assessing heart performance, and the interpretation of electrocardiographs. This is followed by sections dealing with the disturbances of function resulting from heart diseases and those brought about by surgical attack on the heart. Other chapters deal similarly with the physiology of the respiratory, alimentary, urinary, endocrine, and nervous systems, and with related questions of applied physiology. There are also chapters on genetics in relation to clinical medicine, on allergy and immunity, and on the physical and chemical basis of cancer chemotherapy. Naturally, the fluid balance receives full attention, and there are good accounts of the physiology of haematopoiesis, of the metabolism of iron, of the serum proteins, and of defects of haemostasis.

Altogether the book contains nearly a hundred sections by 130 contributors, the majority British surgeons, with some physicians and laboratory workers, and a small but distinguished group of surgeons from the United States and Canada. The writing is vigorous, succinct, and lucid and the general standard of presentation is uniformly high. This is a book to be prized.

CHARLES ILLINGWORTH.

Respiratory Disease in Childhood

Disorders of the Respiratory Tract in Children. Edited by Edwin L. Kendig, jun., M.D. (Pp. 834+xxiii; illustrated. £9 2s.) Philadelphia and London: W. B. Saunders. 1967.

The ambitious aim of this work is to provide an answer to almost any question about respiratory disease in childhood which could be asked by paediatricians or their residents, by chest physicians, radiologists, general practitioners, or by medical students. This is stated by the editor in his preface, and in a foreword Dr. Amos Christie writes that Dr. Kendig has brought together in this timely volume all that is currently known of those conditions of the chest which are unique to the paediatric age group.

Dr. Kendig and his 28 associated contributors have certainly made a determined attempt to justify these remarks. Starting with sections on the functional basis of respiratory physiology, the history, physical examination, diagnostic and therapeutic procedures, and the age factor in respiratory tract disease, the book continues with disorders of the newborn, followed by disorders of the nose, mouth, pharynx, larynx, and ear, then infections of the upper and lower tract, then non-infectious disorders of the lower tract, other diseases with a prominent respiratory component, and, finally, traumatic disorders.

The sections on asthma, tuberculosis, and cystic fibrosis stand out among the practical clinical subjects in their exposition, but all the conditions described are well done. Even the rarities like thesaurosis, alveolar microlithiasis and proteinosis, milk-related pulmonary haemosiderosis, pertussoid eosinophilic pneumonia, and dysautonomia receive attention.

There are some minor criticisms. No mention is made of the enanthem of infective mononucleosis; in the treatment of pneumococcal pneumonia the old-fashioned recommendation that "antimicrobial therapy should be continued for several days after defervescence and until clearing is present on the *x*-ray" is unfortunately perpetuated; in considering hydrothorax it is stated that sleeping in the semi-erect posture may provide some comfort but is not very practical for small children and infants—one wonders why not, seeing that our patients in these age groups with hiatus hernia are regularly nursed in their sentry boxes; the clinical description of respiratory syncytial virus infection is too scanty to be of value. Finally, four pages devoted to pictures of various tuberculin tests seems excessive and there is no mention of the intradermal jet technique, which is likely to be the method of choice in the future both for tuberculin testing and for giving B.C.G. There is no reference to the value of isoniazid-resistant B.C.G.

However, all paediatricians and chest physicians will find something of interest and value in this book and the extensive bibliographies enhance its usefulness. It is well produced and the printing and typography are excellent. There are 834 pages (including 44 for the index), 66 tables, and more than 350 figures. Unfortunately some of the figures are very poor, particularly those depicting intra-oral conditions, for which coloured plates are really required, and some of the *x*-rays and sections are indistinct. Fig. 64.2 is upside down and Fig. 41.15 on p. 412 should read 41.12.

If the non-essential figures and tables had been omitted the book would have been cheaper to produce and no less valuable to the reader.

WILFRID GAISFORD.

Mixing Medicine and Morality

The Anxiety Makers. Some Curious Preoccupations of the Medical Profession. By Alex Comfort. (Pp. 208; illustrated. 30s.) London: Thomas Nelson. 1967.

The main part of this book consists of descriptions and excerpts from past writings on sexual behaviour and morality. There is only a brief reference to classical literature, and the author passes swiftly to sexual manuals, such as *Geneanthropeia,* by Giovanni Sinibaldi (1642), a professor of medicine in Rome, which appeared in English in 1658 as *Rare Verities, the Cabinet of Venus Unlocked*—a mixture of classical and mediaeval folklore. The material was reprinted, little altered, in 1771 under the title *La Génération de l'Homme, ou Tableau de l'Amour Conjugal,* by Nicolas Venette, Dean of the Faculty at La Rochelle, a book designed to teach us how "to preserve our health through moderate use of the pleasures of marriage." Most of this was a mixture of sense and nonsense, on the whole designed to titillate, but by the 19th century sex had become a source of deep anxiety to medical writers. Comfort concentrates his fire on William Acton's (1857) treatise on the *Function and Disorders of the Reproductive Organs in Youth, in Adult Age and in Advanced Life,* but he fully describes the epidemic of anxiety about masturbation which raged through the 18th and 19th centuries. Normal women were described as having no sexual desires; intercourse was hazardous at all times and extremely dangerous during pregnancy and menstruation; masturbation was a prime cause of insanity; venereal disease and pregnancy were a just penalty for misdemeanours. Comfort devotes a chapter to constipation and inner cleanliness, with special reference to Arbuthnot Lane, his kink, and his colectomies.

We must agree with Comfort's thesis, which is that doctors have in the past made totally erroneous statements about the effects of masturbation, sexual intercourse, continence, contraception, constipation, etc., and until recent years at any rate have failed to collect scientific evidence on these topics. Speaking in their capacity as doctors, they have pronounced on the morality of premarital intercourse, abortion, contraception, and artificial insemination, when morality is not their proper business. Worst of all, they have mixed and muddled up medical and moral judgements. Granted all this, sexual anxiety is and has been widespread in communities which have been without benefit of doctors, and psychosexual evolution in industrial communities with social security services can hardly be left completely undirected.

The picture of young people's behaviour today, presented in Nell Dunn's *Up the Junction* and Christiane Rochefort's *Josyane and the Welfare,* is not an attractive one, and while Comfort has performed a useful service in demonstrating past errors he leaves us with little guidance for the future.

L. J. WITTS.

Neuroradiological Topics

Pneumoencephalography and Cerebral Angiography. By Bernard S. Epstein, M.D. (Pp. 349+xiii; illustrated. £7 10s.) London: Lloyd-Luke. 1966.

Dr. Epstein is a prolific writer on neuroradiological topics and is well known on both sides of the Atlantic. One can be sure that anything he writes is to the point and stems from his own very wide experience.

This new book is divided into four large chapters: normal pneumoencephalogram and angiogram, congenital malformations, vascular lesions, and brain tumours. The first half of the first chapter dealing with pneumographic anatomy appealed most to the reviewer. The intricacies of the basal cisterns are not easy to understand; although there are several accounts in various textbooks this is one of the clearest. Not only are the radiographs well chosen but the photographs of the author's own dissections of the brain are very well selected.

The section on tumours is the largest. This is a most difficult subject to tackle comprehensively, and it is sometimes not easy to marry up the various pneumographic and angiographic pictures associated with any particular lesion.

The illustrations throughout the book are generally speaking clear, and although the last figure is numbered 219 there are in fact about three times this number of pictures. All the illustrations are small, the largest being less than 2½ in. (6 cm.) square. While this has the advantage of packing a great many into a small space and several pictures on to the same page, it sometimes makes interpretation difficult, particularly for the uninitiated.

References are appended at the end of each subsection of a chapter. In all there are something over 1,000, divided into about 50 sections. They are up to date and well selected for the most part, but unfortunately there are hardly any from the French schools.

JAMES BULL.

Recognizing Haemoglobinopathies

An Introduction to the Haemoglobinopathies. And the Methods Used for their Recognition. By H. E. Hutchison, M.D., F.R.C.P. (Glasg.), F.C.Path. (Pp. 88 + vii ; illustrated. 30s.) London : Edward Arnold. 1967.

This book comprises in 80 pages basic information on haemoglobinopathies which include diseases arising from abnormal haemoglobins as well as the thalassaemias, which are the outcome of an inability to form enough normal adult haemoglobin.

The introduction gives fundamental facts on the structure of haemoglobin and there is a discussion of the physiological human haemoglobins as well as of abnormal variants. The distribution of the haemoglobinopathies and their clinical and haematological diagnosis are discussed, and there are also excellent explanations of their inheritance and of the nature of the anaemias. Arising from this, a section of the book allows the laboratory worker to look up the basic methods he requires. In the next edition the author when describing the amino-acids of the α and β chains of haemoglobin A might take account of recent work in which some of the residues described as being of aspartic and glutamic acid are now known to be residues of asparagine and glutamine respectively. Also, the only method for electrophoresis used is starch gel electrophoresis, and many laboratories would find it useful to have instruction referring to other techniques such as paper and cellulose acetate electrophoresis.

There is no doubt that this book will have a considerable appeal to a wide circle of clinicians as well as laboratory workers, and it is highly recommended.

H. LEHMANN.

"Labour Movement at its Best"

The Manor House Hospital. A Personal Record. By Samuel James Woodall, M.A., M.R.C.S., L.R.C.P., D.P.H. (Pp. 214 + x ; illustrated. 40s.) London : Routledge & Kegan Paul. 1966.

In September 1914 a British surgeon, Dudley Wright, volunteered to take a surgical unit to France and very soon opened a hospital in Yvetot. A year later the hospital was taken over by the French Red Cross and the English supporters of the hospital decided to open a hospital near London "for the treatment of disabled soldiers and sailors from our own Services." Manor House, situated in North End, Hampstead, was purchased, repaired, and extended and the new hospital was opened on 29 September 1917 by Field Marshal Sir William Robertson. The London Committee adopted the title of "The Industrial Orthopaedic Society" and every regular subscriber became eligible for treatment there if necessary.

The first few years were difficult but the Ministry of Pensions helped, and gradually the hospital grew in importance. New buildings were erected and it became successfully established. Several factors contributed to this, not least among them the emphasis on rehabilitation and the cultivation of a friendly atmosphere. Although many large sums were contributed by well-to-do persons, a large part of the income came from thousands of industrial workers who gave one penny a week. Paid organizers were stationed in different areas of the country and the number of such subscribers rose from 24,000 in 1921 to 300,000 in 1945. The members of some large trades unions joined *en masse* and many Labour leaders took great interest in the hospital—Ernest Bevin, Viscount Alexander, J. H. Thomas, Sir Ben Smith, and Mr. Ramsay MacDonald. The last mentioned said "that such institutions as the Manor House Hospital, which represented the mind of the working people, were characteristic of the Labour movement at its best." A great factor in the hospital's success was the personality of the first resident surgeon—Ambrose Woodall—who served from 1924 till 1958. He was well-qualified, experienced, tactful, and hard-working, and, having a clear vision of what was needed, wisely advised the lay committees on essential matters. He was also an expert on the medico-legal aspect of compensation cases and this added to the reputation of the hospital. His achievements were publicly recognized by the conferment of a knighthood in 1931 and by his elevation to the peerage in 1945.

The writer of this history—Samuel James Woodall—was the brother of the resident surgeon and served as physician to Manor House Hospital for many years ; to him Lord Chorley pays a moving tribute in the foreword.

When the National Health Service began in 1948 the Manor House Hospital (with the exception of the dental and ophthalmic departments) remained outside the control of the State. No reason for this is specifically given in the book, but careful readers will no doubt judge for themselves.

GENERAL PRACTICE OBSERVED

Study of the Demand for Urgent Treatment in General Practice

J. A. FORBES,* M.A., M.D.; L. M. M. MUTCH,* M.B., CH.B.; G. T. SMITH,* M.A., B.M., B.CH.;
A. J. TULLOCH,* M.B., CH.B., D.OBST.R.C.O.G.

Brit. med. J., 1967, 3, 856–858

The service that general practitioners give to their patients is based largely on the demands as opposed to the needs of their patients. As a result a disproportionate amount of time may be spent on the trivial and self-limiting, to the detriment of those patients who suffer from serious conditions.

The distribution of disease in general practice has been extensively investigated (College of General Practitioners, 1962, 1965). A more specific approach has been made by Backett *et al.* (1954), Brotherston *et al.* (1959), and Fry and Dillane (1964) by estimating the severity of conditions met with in general practice.

In this study we have looked at the subject from a different viewpoint. An appointment system has been used in this practice for six years. It has proved workable, and acceptable to the majority of patients, but one of the difficulties of such a system is that it needs to be flexible enough to accommodate those patients who come requesting treatment at short notice. If demands of this type are excessive the amount of time which the general practitioner can allot to the supervision of patients suffering from chronic conditions is reduced.

This investigation was initiated to study the nature and extent of this element of urgent demand so that plans could be made to ensure that those patients with serious chronic disease receive the time and care to which they are entitled.

Method

This practice is based on a small market town of some 8,000 inhabitants: 55% of our patients live in the town, and 45% in the surrounding countryside. The survey was confined to surgery attendances. Requests for home visits, antenatal attendances, and attendances at infant welfare clinics were excluded.

Urgent demand was defined as follows: when a patient made contact with the practice and stated that his condition was such that he required medical advice on the same day, he was regarded as having made an urgent demand. The onus for deciding whether treatment was necessary rested with the patient. When such a patient attended the surgery the first part of a form consisting mainly of identification data was completed by the clerical staff. The second part of the form, which included the diagnosis, the reason for the patient's attendance, and the time taken for consultation, was completed by the doctor who treated the patient. The information recorded on the form was coded and transferred to punch-cards. The analyses were carried out by means of business machines under the aegis of the Oxford Record Linkage Study. Information about the age and sex structure of the practice and its geographical distribution during the survey was derived by means of a system of data retrieval described elsewhere (Acheson and Forbes, 1967).

Results

The number of patients at risk midway through the study was 6,850. About one in four who attended the surgery during the nine-week period thought that treatment was necessary the same day (Table I). It would seem, therefore, that about 25% of all surgery appointments should be allotted to patients requiring urgent treatment. It will be seen from Table II, however, that the daily distribution is uneven, suggesting that the number of appointments reserved for urgent cases should vary according to the day of the week.

TABLE I.—*Proportion of Urgent Attendances Demand Compared with Routine Attendances*

No. of urgent attendances	775 (26·7%)
„ „ routine attendances	2,131 (73·3%)
	2,906 (100·0%)

TABLE II.—*Proportions of Urgent Demand Attendances by Week-day*

	No. of Attendances
Monday	255 (32·9%)
Tuesday	132 (17·0%)
Wednesday	115 (14·8%)
Thursday	111 (14·4%)
Friday	93 (12·0%)
Saturday	69 (8·9%)
	775 (100·0%)

Attendance rates by age and sex were computed from the age and sex distribution of the total practice (Table III). Pre-school children made greater demands in relation to their numbers in the practice than the other groups. The middle-aged and elderly made fewer demands relative to their numbers, and attendance rates in young pre-school boys was almost four times that in elderly men.

The practice is divided into five zones—central, north, south, east, and west. The central zone is the town in which the practice premises are situated, and the surrounding country-

TABLE III.—*Urgent Attendance Rates by Age and Sex*

Age Group	Males		Females	
	No. of Attendances	Attendance Rate/1,000	No. of Attendances	Attendance Rate/1,000
Pre-school (0–4 yrs) ..	91	208	68	153
School (5–14 yrs) ..	65	111	72	131
Young adults (15–44 yrs)	139	119	183	118
Middle-aged (45–64 yrs)	71	77	63	99
Elderly (65+ yrs) ..	12	53	11	48
Total	378		397	

---

* General Practitioners, Bicester, Oxfordshire.

side, containing a number of villages, is divided into quadrants. From our knowledge of the number of patients in each zone it was possible to compute attendance rates for each zone during the study (Table IV). We had anticipated that the patient's decision to attend surgery for urgent consultation might be influenced by the distance he lived from the surgery, but this did not appear to be generally true ; for example, in the north zone the female attendance rate exceeded that in all other zones.

Table IV.—*Attendance Rates for Urgent Treatment by Zone*

Zone	Males		Females	
	No. of Attendances	Attendance Rate/1,000	No. of Attendances	Attendance Rate/1,000
Central..	237	121	231	117
North	33	125	64	171
South	50	81	48	105
East	34	123	21	77
West	24	98	33	116
Total	378		397	

A classification of the cases in terms of diagnoses made is shown in Table V. During the study a distinction was made between upper respiratory tract infections ; cardiac and respiratory conditions ; conditions of the ear, nose, and throat ; and eye infections ; it was found, however, that the vast majority of these patients were suffering from acute infections of the upper respiratory tract. In Table V, therefore, all these conditions are grouped under "upper respiratory tract infection." Similarly, a distinction was made between trauma and skeletal conditions—for example, low back pain—but the distinction often proved difficult to make, and consequently all those in these two groups have been classified under the heading of trauma. About 65% of all patients attending for urgent treatment were suffering from upper respiratory tract infections or trauma, a fact which has important implications should a trained nurse be employed. With some experience and judgement it should be possible for her to treat, or at least temporarily reassure, a large proportion of the patients in this group.

Table V.—*Classification of Cases by Diagnosis*

	No. of Attendances
Upper respiratory tract infection, etc.	386 (49·8%)
Trauma	118 (15·2%)
Skin..	78 (10·1%)
Alimentary	74 (9·5%)
Genitourinary	40 (5·2%)
Psychiatric	28 (3·6%)
Obstetric	6 (0·8%)
Cerebrovascular/neurological	4 (0·5%)
Other	41 (5·3%)
	775 (100·0%)

An attempt was made during the study to determine why each patient had decided that treatment was required urgently. It seemed to us that the majority of patients could be placed in one of the following categories: (1) the patient was suffering from a condition which merited urgent treatment ; (2) the patient was suffering from a condition which could not be regarded as urgent, and his primary reason for attendance was to seek reassurance ; and (3) the patient was inconsiderate or frivolous.

We were aware that the placing of patients in one of these categories was arbitrary, and subject to observer variation. What may appear to an overworked doctor to be inconsiderate or frivolous behaviour on the part of a patient may not appear as such to the patient, or indeed to another doctor. In the same way a man of 55 with chest pain of sudden onset is suffering from a condition meriting urgent consultation, but at the same time he is also seeking reassurance. Despite the disadvantages, we felt that an attempt to explore, even superficially, the motivation for seeking urgent medical advice was justified, and the question was included in the study, with the proviso that any results should be treated with reserve (Table VI).

Table VI.—*Reason for Seeking Medical Advice in Total Number of Patients Attending for Urgent Treatment*

	No. of Attendances	
	Males	Females
Condition merited treatment urgently ..	145 (38·4%)	118 (29·7%)
Need for immediate reassurance	142 (37·6%)	174 (43·8%)
Patient was inconsiderate or frivolous ..	71 (18·8%)	90 (22·7%)
Other reasons	20 (5·2%)	15 (3·8%)
Total	378 (100·0%)	397 (100·0%)

During the study it became clear that a number of patients had made more than one demand for urgent treatment during the nine-week period, and this was confirmed when the results were analysed. Eighty-six patients (47 males and 39 females) were responsible for 190 items of urgent demand, constituting 24.5% of all urgent attendances. Our results also showed that 146 family units* created 362 items of urgent demand—that is, 47% of all urgent demand. To put it another way, the representatives of 146 families, composed of some 500 persons (approximately 7% of the total practice) were responsible for almost half of all the demands for urgent treatment during the survey period.

Discussion

Though the immediate aim of this study has been to examine the nature and extent of urgent demand for medical advice and treatment, the long-term objective is to organize our work in such a way that more time is spent where it is most needed. We hold the view that patients who present with an acute illness, whether trivial or serious, are already receiving a first-class service, but that our supervision of those suffering from chronic conditions is of indifferent quality. Our problem, therefore, is to maintain the standard of service given to the acutely ill, and at the same time, with our limited resources, to improve the standard of care given to those suffering from chronic disease.

In an attempt to achieve these long-term objectives we propose taking the following measures.

(1) There appears to be no reason why a trained nurse should not filter a large proportion of urgent demand cases. It has been shown that urgent demand constitutes 25% of surgery attendances, so that if a nurse could advise or treat even half of those patients a considerable saving of doctors' time would be effected.

(2) We propose identifying those patients who feel the need for repeated attendances at a doctor's surgery. Clearly, they need support, advice, and education in the use of the general-practitioner services. With the help of the district nurse, the health visitor, and, if possible, a medical social worker we hope to be able to do this and relieve some of the pressure on the general practitioner. We suggest that a full-scale medical and social investigation of these families would yield valuable information.

(3) During the past few months a chronic disease register has been compiled, consisting of those patients who require regular supervision. It is proposed that these patients should no longer be seen during surgery hours but at special clinics, when more time can be spent with each patient. This will also have the effect of reducing the numbers attending during regular surgery hours.

Summary

Our investigation into the nature and extent of urgent demand in a general practice during a nine-week period showed that 25% of surgery attendances were urgent, the heaviest demand being made early in the week. Attendance rates were

---

* A family unit was defined as a husband and/or wife and/or children living at the same address.

highest in young children. Two out of three patients were suffering from infection of the upper respiratory tract or trauma. It appeared that the distance the patient lived from the surgery played little part in his decision to seek medical advice urgently.

Eighty-six patients were responsible for about a quarter of all attendances, and 146 families for almost half of all urgent demands.

The measures proposed to be taken on the basis of these results are outlined.

We wish to record our thanks to Dr. E. D. Acheson, Director of the Oxford Record Linkage Study, for his helpful advice.

The practice described is associated with the Oxford Record Linkage Study, and one of us (J. A. F.) is in receipt of financial support from the funds allocated by the Nuffield Provincial Hospital Trust to that Study.

HOSPITAL TOPICS

Neasden Memorandum on Resuscitation

On 16 May 1966 a memorandum on resuscitation after respiratory failure and cardiac arrest was issued by the physician superintendent of Neasden Hospital to all medical officers and senior nursing staff. This stated that

"The following patients are *not* to be resuscitated:

Very elderly, over 65 years.
Malignant disease.
Chronic chest disease.
Chronic renal disease.
Top of yellow treatment card to be marked N.T.B.R. (i.e., not to be resuscitated).

The following people *should* be resuscitated:

Collapse as a result of diagnostic or therapeutic procedure—e.g., needle in pleura (even if over 65 years).
Sudden unexpected collapse under 65 years—i.e., loss of consciousness, cessation of breathing, no carotid pulsation."

The existence of this memorandum was disclosed in the B.B.C. television programme *Tomorrow's World*, which was shown on 20 September. Subsequently it was discussed extensively both on television and in the national press.

Committee of Inquiry

On 22 September a statement was made by a committee set up by the North-west Metropolitan Regional Hospital Board to inquire into the circumstances in which the notice was issued. The members of this committee comprised Miss E. Richards, F.R.C.S. (vice-chairman of the board), Sir Charles Harington, F.R.S. (member of the board), assisted by Dr. F. J. Fowler and Mr. G. H. Weston, respectively senior administrative medical officer and secretary of the board. The statement reads as follows:

"In considering the problem it is important to differentiate between emergency action to combat collapse or a sudden worsening in the condition of the patient which may occur for a variety of possible reasons in the course of an illness and action to remedy 'cardiac arrest' which sometimes occurs in a patient whose life is already in grave jeopardy due to a serious and irreversible complaint but may occur in the course of an illness from which recovery is possible. It should be understood that a patient whose heart stops beating dies unless cardiac action can be started again within at most three minutes, and that the instructions issued were concerned with attempts which must be made within seconds to restore life before the condition becomes irreversible and the patient dies. Action to remedy cardiac arrest can only be appropriately taken in certain cases and each individual case must be a medical decision.

"The Board is assured that no patient who might have benefited by resuscitative treatment during the currency of the notice failed to receive it.

"On the authority of the Vice-chairman of the Board (in the absence of the Chairman abroad) the Board has accepted the report and is acting upon its recommendations. A copy has been sent to the Minister of Health, who has informed the Board that he also accepts the report.

"The findings of fact of members of the Committee of Enquiry are as follows:

"(1) That the idea of issuing instructions on the selection of patients for resuscitation arose from responsible discussion by medical staff in the Central Middlesex Hospital Management Committee Group and their decision that guidance to medical staff and in practice to nursing staff was necessary in the light of experience of wrong use of the resources available.

"(2) That it was also agreed that medical staff in clinical charge of patients should mark case papers of patients who should not be resuscitated.

"(3) That Dr. McMath, the physician superintendent, after seeing a film and hearing a talk on resuscitation given to the staff at Neasden Hospital, prepared the memorandum dated 16 May 1966 and circulated it within the hospital.

"(4) That the Hospital Management Committee and the administrative staff were not involved in the decision to issue such a memorandum, in the composition of the memorandum, nor in the means of disseminating it."

The conclusions of the members of the Committee of Enquiry based on consideration of the evidence they elicited are as follows:

"(*a*) That some guidance to medical staff on selection of patients is necessary to the proper use of resources and for the protection of some patients from distressing and unprofitable procedures.

"(*b*) That age is one of the factors on which the decision on an individual patient may properly be taken, but that any guidance given should in no way imply that a patient should be excluded from consideration for resuscitation merely by reason of age or diagnostic classification.

"(*c*) That the decision on each patient should be taken at the highest medical level available in the particular circumstances and should not be left to nursing staff.

"(*d*) That if it is found necessary to mark case papers to denote whether a patient is considered a suitable subject for resuscitation, the guidance relating to the interpretation of any marking symbol adopted should not be displayed but should be communicated in confidence to staff who need to be aware of it.

"(*e*) That guidance issued relating to the procedure to be adopted by nursing staff for summoning the resuscitation team in cases of cardiac arrest should be given separately from guidance given regarding interpretation of the marking system.

"(*f*) That although Dr. McMath's initiative in attempting to formulate guidance for medical staff on the selection of patients for resuscitation is in itself to be commended we regard the wording of the memorandum issued over his signature as particularly unfortunate and we greatly deplore its distribution in a way which rendered it liable to public view, in which position it remained unchallenged over a considerable period.

"(*g*) That we support the action taken by the Senior Administrative Medical Officer on

Friday, 15 September, following the withdrawal of all copies of the memorandum and agree that the advice which he gave should forthwith be confirmed in writing to all staff concerned at the hospital—namely,

> "'The conditions in which resuscitation measures for cardiac arrest should be applied are under review. Meanwhile, medical staff should know that they are to use their own judgement on individual cases to decide whether resuscitation is to be applied and they are not to be restricted merely by categories of age or diagnostic classification.'

"(*h*) That we welcome action already taken to obtain information as to any procedure adopted in other hospitals in the region.

"(*i*) That we wish to emphasize that in this Enquiry we find grounds for criticism only in relation to the instruction given concerning the application of resuscitation procedures to patients presumed to be suffering from cardiac arrest. These procedures involve mouth-to-mouth breathing, speedy removal of the patient from the bed to the floor, and external cardiac massage, which are initiated by the nursing staff or any doctor available and are continued with the addition of other special procedures by the resuscitation team when it can arrive.

"We are satisfied that although cardiac resuscitation by these special methods will not be appropriate for some patients every treatment appropriate to each patient is given in cases of sudden deterioration within the resources available."

Ministry Statement

On 23 September the Ministry of Health announced that its chief medical officer had written to the chairmen of group medical advisory committees and medical advisory committees of teaching hospitals. This letter stated that the Minister had taken professional advice on this subject as a matter of urgency. This advice was that no patient should be excluded from consideration for resuscitation by reason of age or diagnostic classification alone, and without regard to all individual circumstances. Any form of general instruction was wholly unacceptable. The letter added that, as all doctors concerned knew, only a very small number of patients in hospital were affected by cardiac arrest in circumstances in which it would be possible to take measures which could be effective in reversing the process and restarting the action of the heart. Continuing, the letter stated that the nature of the decision to be taken was no different in principle to that required in other grave circumstances, and a decision to operate on a patient or to refrain from intervention might often be of similar importance. In such a situation the decision to attempt resuscitation must be the decision of the responsible doctor in each individual case. While age was a factor which might properly be taken into account, it was only one of many factors involved, and these must include in any individual case both the nature of the underlying disease and the doctor's assessment of the likelihood that any attempt to resuscitate would be successful.

The letter concluded by pointing out that these views had been formulated in consultation with the Minister's consultant advisers in medicine and his adviser in cardiology.

CONFERENCES AND MEETINGS

Laboratory Screening Procedures

[FROM A SPECIAL CORRESPONDENT]

"Laboratory screening procedures and their clinical implications" was the title of a joint symposium held at the Middlesex Hospital Medical School between the Association of Clinical Pathologists and the Clinical Section of the Royal Society of Medicine on 23 September.

From the chair Professor Sir **MAX ROSENHEIM**, P.R.C.P. (London), asked whether the detection and treatment of all mild hypertensives would prevent cardiovascular complications in later life. This question at once exposed our ignorance of the natural history of disease, the importance of early diagnosis to the clinician, and the problems of manpower and cost of screening programmes. There was need for careful observation and clinical trial of such programmes before it could be decided whether they were worth while.

Professor L. G. **WHITBY** (Edinburgh) was concerned with the screening of well populations—that is, people who were asymptomatic. Much work had been done in the United States, and indeed a Congressional committee had spent three days considering the subject. The Kaiser Permanente Foundation in California had a screening centre operated on production-line principles, which took three hours to perform a multitude of investigations, both biochemical and clinical (including sigmoidoscopy on those over 40), annually on its subscribers at a cost of $30 (£10). The Varmland Health Screening Project was a multiphasic programme offered once only to all those over 25 in the province of Varmland, in Sweden. In the latter, 75% of those invited had taken part; 12% were found to have abnormalities—4% known to the doctor, 5% unsuspected findings of diagnostic value, and 3% abnormalities for which there was no apparent explanation on further investigation, such as proteinuria.

Professor Whitby himself had been concerned with an investigation in Edinburgh, in which 12 biochemical analyses were performed on samples from 1,080 patients attending two general practices. This had allowed the findings to be considered in relation to what the doctors already knew about the patients. The main findings were the detection of some diabetics, some raised blood-urea levels, and some unexplained serum-bilirubin values between 1.1 and 1.7 mg./100 ml. But what had become apparent was that there were difficulties in calibrating the analysers used, and in standardizing the tests with regard to collection and handling of the specimens, and the time of day, venous stasis, diet, posture, and drug intake of the patient. Finally, there was the need to compare the results with previous readings on the same patient. Sophisticated record storage, retrieval systems, and statistical analyses were all essential if full use was to be made of the data derived from well-population screening.

Hospital Studies

Dr. T. P. **WHITEHEAD** (Birmingham) was concerned with the investigations done on patients in hospital. A unit with 550 sq. ft. (49.5 sq. m.) of floor space had been built and equipped to carry out a screening programme of 16 biochemical determinations on about half the intake of inpatients to the Queen Elizabeth Hospital, Birmingham, at a cost of £15,000. The object of the survey was to see whether an initial battery of tests was of more value to the patient, or saved money by reducing bed-occupancy and transport of specimens, than tests done at the discretion of the doctors during the patient's stay in hospital.

A questionary had subsequently been sent to the clinician concerned asking in respect of each test whether it would have been requested—and, if abnormal, whether this would have been expected, whether it had led to a new diagnosis, or whether it had remained unexplained. Of 15,816 tests analysed, 1,203 had been abnormal, 114 had provided a new diagnosis, and 752 had remained unexplained. Data relating to bed-occupancy had not yet been evaluated. It was important, Dr. Whitehead concluded, to avoid seeking figures for figures' sake, and not to produce data on which no action would be taken.

In paediatrics much interest had been aroused by the possibility of screening for genetically determined metabolic disease, Dr. L. I. WOOLF (Oxford) said. Thirty States in the United States had made testing to exclude phenylketonuria a legal requirement. Nevertheless, not all patients with even serious enzyme defects showed clinical signs of disease. But screening to detect cases of phenylketonuria, galactosaemia, maple-syrup urine disease, histidinaemia, and alkaptonuria might be expected to prevent suffering and to save expensive institutional care.

Screening for Phenylketonuria

Valuable lessons were to be learnt from the history of screening for phenylketonuria. It had been thought that simple urine tests which could detect levels of phenylpyruvic acid in the urine above 5 mg./100 ml. were adequately sensitive. But now it was realized that more investigation must be undertaken to determine the rate of the rise in serum phenylalanine and its metabolites after birth, because, on the one hand, the time of testing might be too late for those whose levels had risen rapidly, and, on the other hand, too early for those whose levels were rising slowly. Probably the latter accounted for a substantial percentage of cases which were missed. Dr. Woolf said that now his laboratory employed a chromatographic technique, in which other tests could be done simultaneously, which cost £104 per 10,000 tests for materials. About one million children were born in Britain every year, and one should aim at testing 99% of them.

Mr. G. TEELING-SMITH (Office of Health Economics, London) pointed out that very uneven demands were made by the public on the health services: some resorted to their doctors on very minor indications, and others did not go until they were seriously ill. No method had been devised for telling people when to go or how to recognize the gradual onset or biochemical phase of insidious diseases clinically. It had therefore become necessary to examine people who were unaware of any illness. The factors affecting the cost of such screening were: the cost of doing the test; of contacting the people on whom the test was to be done; of following up those in whom the results were positive; and the frequency with which rescreening was necessary.

The benefits of screening were related to the seriousness of the diseases found; the prevalence of the disease in the community investigated; the sensitivity of the test (whether, for example, there were many false-positive results); whether the disease could be affected by earlier treatment; and whether the treatment itself was acceptable to the patients. In economic terms it would cost, for example, £1½m. to screen the population of Great Britain for diabetes; £300,000 annually to continue the programme; and £2½m. to treat the new cases found. The result would undoubtedly be to increase the cost of the Health Service, and this must be faced. Ultimately there might be a reduction in hospital bed costs, and it might reduce the unnecessary calls made on general practitioners. It would probably contribute little to the national economy because the earning capacity of those treated would be only slightly increased.

In Britain, Mr. Teeling-Smith continued, there was a very cautious attitude to screening programmes. It had been recognized that there was a great lack of knowledge of the natural history of many diseases. Were the patients with raised blood-sugar levels merely a physiological variation from the norm, or suffering from a temporary or a permanent abnormality? He believed that great progress would be made in such differentiation, that much information would come from comparing successive screening results in individuals, and that biomedical engineering would make great strides.

Choice of Tests

Professor HENRY MILLER (Newcastle upon Tyne) thought that laboratory screening should be for hospital patients and that tests should be dictated after a little sifting by the intelligence. In his opinion a lot of chaff was sifted for little grain. Twenty years ago such a discussion would have been unthinkable. A routine battery of tests would have been regarded as depreciating clinical method and grossly extravagant. It was a tribute to the advance in technology that Dr. Whitehead thought that an initial battery of tests would be less extravagant than the series of tests ordered during the inpatient stay on clinical grounds.

Professor Miller would have liked to extend his battery of tests a little beyond the routine now employed to save him from his crasser diagnostic errors. But it was very necessary to establish firmer criteria of normality and to define the scatter of tests used. For example, vitamin-B_{12} levels were far from well defined. Furthermore, computer analysis of screening results might reveal marginal changes in abnormal values of well-investigated diseases, which were not now taken into account for either diagnosis or treatment. This might confirm his belief that many neurological diseases were manifestations of generalized conditions. He concluded that the modern physician should seek help from all sources, and help from autoanalysers was no more humiliating than help from a stethoscope.

Types of Screening

In the discussion Professor W. M. DAVIDSON (London) said that one could not compare screening for tuberculosis with screening for biochemical errors. Professor J. G. SCADDING (London) added that screening to find tuberculosis not only allowed the affected person to be treated but also prevented him from giving the disease to others. In the case of cancer of the lung screening 100,000 people might save 2.5 extra five-year survivors annually. If, on the other hand, the money was spent on campaigns against smoking, in five years' time 25 people a year would not be developing cancer of the lung who otherwise would have done. A veterinary surgeon, who said that his profession was freer to use eugenic methods, asked those whose screening activities were encouraging the wider distribution of mutant genes what they told the owners of such genes to do about future procreative activities.

Other speakers from the floor pointed out that patients were more encouraged to go to screening clinics than to their own general practitioners, and that general practitioners could do annual examinations if they had adequate secretarial and nursing help. The finding of inexplicable abnormalities in a well population produced psychiatric difficulties which outweighed the value of the screening programme, said another speaker. Professor MILLER explained that we were not, unlike the veterinary surgeons, breeding for specific genes, although some genes could probably be wiped out quite easily—for example, those responsible for Huntington's chorea. Personally, he concluded, he did not go either to his general practitioner or to the screening clinic until he had something wrong with him; nor, he was prepared to bet, did the majority of the audience have an annual check-up, which did not cause but catered for hypochondriasis.

Letters to the Editor should not exceed 500 words.

Psychotropic Drugs

SIR,—Some comments on the latest Dunlop Committee's report on psychotropic drugs[1] seems desirable. The Committee is still somewhat lacking in clinicians working whole time at the bedside. Things can too often get out of clinical-treatment perspective when sitting in committee chairs. In psychiatry, for instance, we are getting rid of our administrative hospital medical superintendents only to replace them by administrative professor superintendents, sitting on from 20 to 40 committees apiece. This makes us worse off than ever before when something like the skilled clinical use of psychotropic drugs is under discussion.

Even if there had been 500 deaths instead of a mere 100 in the 43 million prescriptions for psychotropic drugs (around 1 in 500,000 prescriptions) it would still have been well worth while to use them as intensively as necessary. For we have to try to help not only the 30,000 people endeavouring to kill themselves each year but also the quarter to one-third of all patients coming to general practitioners and general consultants with neurotic illnesses. And, using these drugs in large amounts and in many varied combinations in the department of psychological medicine at St. Thomas's and elsewhere in recent years, we can confirm that disasters have been extremely rare. Most can generally be avoided by skilled handling.

Several patients, for instance, have now been on iproniazid for up to five years with none of Professor Sherlock's postulated deaths from liver damage.[2] Supposed "Largactil jaundice" has also almost disappeared despite the ever-increasing use of this drug, probably due to the present decline in cases of infectious hepatitis. The only suggested "Nardil jaundice" death was in a village where there were around 15 other cases of infectious hepatitis in the vicinity.[3] Will the Dunlop Committee now tell us how many cases of clinical jaundice and death were reported among the 43 million prescriptions for psychotropic drugs? They have suddenly become silent on this point. Was the whole thing only another medical professorial scare, as I have repeatedly suggested?

The monoamine oxidase inhibitor group of antidepressant drugs also continue to be safely combined with amitriptyline or trimipramine in large numbers of patients. Fainting may, however, occur with combined imipramine and phenelzine sulphate or isocarboxazid in some patients. None, however, seem anywhere near to dying with "convulsions and hyperpyrexia" unless they have taken an overdosage of one or both drugs; and complications are almost nonexistent when these drugs have been given in definite known amounts to patients under supervision in hospital. We have also given 400 courses of combined narcosis treatment involving the use of up to 1,000 mg. of chlorpromazine a day combined with both groups of antidepressant drugs and E.C.T.—again complications are minimal with skilled clinical handling. There has been one death recently from a cheese reaction—a real and dangerous complication—in a patient taking iproniazid. She continued, despite warnings, to tempt providence once too often by eating cheese, because she had done so several times before without deleterious effects.

About the recommendation that antidepressant drugs should not be used for psychosomatic conditions unless proved to be valuable in controlled clinical trials—how wrong this is. The M.R.C. has already made rather a fool of itself by testing out these drugs *solely* in patients with "Maudsley-Bedlam melancholia" (patients who were ill enough to stay in a mental hospital for months on end being "double blind-sampled"). Many people have been led to believe in consequence that because phenelzine sulphate had little effect on these very depressed and often mad people, which we all knew already, it is also without clinical effect in the sort of cases that constitute a quarter to a third of all patients coming to general physicians at St. Thomas's and elsewhere with psychosomatic disabilities. Here the monoamine oxidase inhibitor drugs, including phenelzine sulphate and isocarboxazid, have proved *clinically* to be some of the best drugs we have for helping psychosomatic states creating prolonged and intense misery and disability. Imipramine hydrochloride and amitriptyline often makes them just so much worse.

Despite these comments I remain aware that the Dunlop Committee is still a paragon of virtue compared with the American Food and Drug Administration, who now "order" doctors what to do rather than "advise" them. Clinicians should be deeply appreciative of the medical liberties we still enjoy in this country, owing to the good sense and restraint of Sir Derrick Dunlop and his colleagues. Suppose we could never do just the opposite to what they advise; how many more patients might kill themselves or remain ill for months or years on end as a result?—I am, etc.,

WILLIAM SARGANT.

Alcohol and Driving

SIR,—On 9 October it becomes an offence to drive with a blood alcohol level greater than 80 mg./100 ml. This change in the law will come as a relief to many doctors.

Clinical examination of drivers suspected of driving while their ability to do so is impaired by alcohol or drugs is essential to exclude disease or injury, but as a means of testing driving ability it is crude.

Two drivers seen recently by us have been unequivocally normal on thorough examination, yet in each case a charge was brought on the basis of police evidence, and blood alcohol levels were 190 mg./100 ml. or more. Each of these cases was dismissed by a jury, the doctor's favourable examination clearly influencing them in their decision, in spite of his frank admission in court of the shortcomings of the clinical method. In two other comparable cases the drivers chose to be tried summarily and were convicted. This emphasizes the absurdities of the present law.

In future, therefore, we shall reserve the right in any of these cases to decline from passing an opinion, at the time of examination, on fitness to drive on the grounds that the laboratory tests are essential to forming such an opinion.—We are, etc.,

Cardiac Resuscitation

SIR,—The recent adverse publicity concerning directives issued to the medical staff at Neasden Hospital will no doubt have disturbed many members of the medical profession. Although there may be some doubt about the wisdom of posting notices stating an arbitrary age limit for resuscitation, we feel that there is a good case for limiting this sophisticated procedure to those likely to benefit. There are great differences between hospitals in the National Health Service, both in equipment and in staff. These obviously will reflect the ability of any one hospital to indulge in resuscitation.

It is regrettable that the British Medical Association, which is believed by a large section of the public to represent the profession, conspicuously failed to point out these difficulties, and in particular failed to support the undoubted integrity of Dr. McMath, who has been made something of a scapegoat.—We are, etc.,

Lithotomy Position for Forceps

SIR,—Dr. Margaret J. Watt (26 August, p. 559) is of course absolutely right in stressing the need to avoid Mendelson's syndrome, this potentially fatal complication of obstetric anaesthesia.

In all four of the triennial reports on confidential inquiries into maternal deaths since 1952[1] it is stated with almost monotonous regularity that the commonest cause of death in forceps delivery under general anaesthesia is inhalation of stomach contents. In the third report (1958–61) there are two statements of the utmost significance which sum up the matter:

> (1) "The only safe assumption in any parturient woman is that the stomach is full," and (2) "The lithotomy position with full flexion of the lower limbs is more likely to favour regurgitation than any other posture."

Until some time between 1920 and 1930 the lateral position was used almost exclusively in Britain—indeed, in Australia it was spoken of as "the English position." In those days, though vomiting of course often occurred, inhalation of stomach contents did not, and I have several times been at pains to indict the adoption of the lithotomy position by obstetricians as the cause of this grave and (when it occurs) often fatal complication of labour.[2, 3] I am not of course arguing in any way against regional analgesia in forceps delivery, but if general anaesthesia is employed, as it still is not infrequently, the use of the lithotomy position is just asking for trouble.

The responsibility for these disasters must lie with the obstetricians as long as they continue to use and teach a method of delivery so fraught with danger to the patient. It should be a sobering thought to them that the deaths in forceps delivery under general anaesthesia could certainly be halved by the simple application of common sense and the observance of the simplest law of physics.

As Dr. Watt points out, there is no method of treatment for Mendelson's syndrome which can guarantee 100% safety, but the simplest of preventive methods will ensure a complete freedom from risk never to be attained by any method of treatment of the established condition.—I am, etc.,

Safer Dental Anaesthesia

SIR,—Unlike Dr. J. G. Bourne (2 September, p. 616), I do not attribute primary importance to the upright position as the main cause of dental anaesthetic mortality. The upright position was, and is, a common feature in operations on the posterior cranial fossa, anaesthesia for which over several hours must be followed by rapid recovery of consciousness, a desideratum which every neurosurgical anaesthetist is familiar with and competent to provide. Moreover, the dental anaesthetic mortality rate fell substantially while the upright position for induction of anaesthesia was still in general use, as it is indeed to this day, and rightly. This decline in mortality was due to various factors—gradual abandonment of deliberate hypoxia, better drugs, better selection of cases for referral to hospital, increased participation in dental anaesthesia by specialist anaesthetists, and latterly increased avoidance of accidental hypoxia by means of tracheal intubation in the dental surgery.[1] Adequate observation of the patient is indeed an important advantage of intubation which hardly exists without it, for in the latter case the anaesthetist is tethered to the support of the patient's jaw and extremely limited as to what he can observe and do.

Interference with the airway, with or without deliberate hypoxia, is a far commoner primary cause of dental anaesthetic difficulties which may lead to death than depression of the cerebral circulation from the upright position alone. In over 6,000 dental anaesthetics I have seen only one patient develop hypotension from the upright position. The semi-recumbent position, however, which is all that some modern dental chairs will permit at their most upright, must surely be condemned by Dr. Bourne as well as myself, for neither in his view nor in mine can it be considered safe for dental anaesthesia.

In my view, differing again from Dr. Bourne, the security and integrity of the airway of the anaesthetized patient are too important to be left to the divided attention of the dental surgeon who is performing the operation; too important to be left to his unqualified assistant; and in other than short cases too important to be left dependent on the reliability of the aspirator and the dental pack. These makeshifts are employed because the non-specialist cannot intubate the trachea even in emergency let alone in cases of above average duration. No matter how skilfully these makeshifts are applied, they cannot compare in safety or reliability with skilled tracheal intubation.

There is a strong case for insisting that those who administer dental anaesthetics should be trained at least to the level of competence in tracheal intubation, which implies considerably more knowledge of basic sciences and clinical anaesthesia and greater and wider experience than is at present the case.—I am, etc.,

Phenylketonuria: A Reassessment of Screening by Napkin Test

SIR,—Drs. J. B. P. Stephenson and M. S. McBean (2 September, p. 582) rightly draw attention to the unreliability of Phenistix testing. They refer to my contributions to Lyman's book on phenylketonuria,[1] but our knowledge of inborn errors of metabolism in general, and of phenylketonuria in particular, is advancing so rapidly that much of this book must now be considered out of date. I wrote my sections on testing and detection in 1961, when Phenistix and similar tests, using ferric salts, were the only screening techniques in use or at the time possible; later Guthrie[3] published his method, and a paragraph on it was added before the book was printed.

In 1963 I began to come across tragic cases of phenylketonuria undetected by Phenistix testing in the neonatal period.[2] It seemed that "field" tests such as Phenistix would have to be replaced by methods where a specimen of blood or urine is sent to a central laboratory for testing by more sophisticated techniques. Choice of a suitable technique poses problems in basic science, technology, economics, administration, and relations between mother and doctor, health visitor, midwife, or nurse. To ignore any of these aspects is to court disaster. Eight different laboratory techniques are currently in use: the Guthrie method using blood[3]; urine chromatography for *o*-hydroxyphenylacetic acid[2]; spectrophotofluorometry of blood[4, 4a]; the Guthrie method using urine[8]; and chromatography of amino-acids in blood by the methods of Berry,[5] Efron,[6] Scriver,[7] or Mellon.[8] All these methods except spectrophotofluorometry have the great advantage that they test for other inborn errors of metabolism as well as phenylketonuria. Two methods, the Guthrie method using blood[3, 9] and chromatography of urine,[2] have now been used long enough and on a large enough scale for us to say that they meet the criteria of a suitable test. Thanks to the co-operation of the medical officers of health of Buckinghamshire, Cardiff, Oxford, and Oxfordshire, about 25,000 newborn infants have had their urine examined here using chromatography. The advantage of this method is that the mother herself can collect a specimen of her baby's urine on filter-paper and post it.[2]

Dr. Stephenson and Dr. McBean may have been unfortunate in their small sample which gave a failure rate for Phenistix of at least 73%. Data collected from all over Great Britain suggests a lower failure rate, but even if only 10% of phenylketonurics go undetected by use of Phenistix this test should be regarded as unsatisfactory now that we have better ones.—I am, etc.,

Respiratory Distress Syndrome

SIR,—We read with interest the paper by Dr. J. M. Abraham and Dr. R. J. K. Brown (9 September, p. 640) comparing the effects of intragastric and intravenous glucose and sodium bicarbonate in the respiratory distress syndrome, and your leading article (9 September, p. 628) on management of the respiratory distress syndrome. We feel that the cases of Abraham and Brown are not truly comparable with those of Hutchison *et al.*,[1] as only 26 cases had positive radiological findings. Forty-three cases were not *x*-rayed, and 10 had negative radiological findings. In contrast with this, Hutchinson's cases all had positive radiological findings.

We have studied 415 infants with respiratory distress since August 1963. Of these, 24 had rarer causes of respiratory distress such as diaphragmatic hernia and pneumothorax, 18 died from other causes, and 59 were not *x*-rayed. Of the remaining 314 cases 150 had radiographs which were normal or showed only localized areas of atelectasis, and the mortality in these cases was only 2%, the three deaths all being in infants of less than 28 weeks' gestation. The good prognosis in these cases shows the necessity of excluding them from studies of the effects on mortality of different methods of treatment.

In your leading article, in discussing treatment of the respiratory distress syndrome with alkalis, you say that "further studies are required to determine the precise effects of these substances and the best way of giving them." We have carried out a study of the effects of intragastric sodium bicarbonate in the respiratory distress syndrome and our findings are to be published.[2] We found a mortality of 58% in 31 cases given intragastric sodium bicarbonate, and 39% in 69 cases given early milk feeds. These mortality figures are higher than those reported by Abraham and Brown, but refer only to cases with positive radiological findings, and are therefore more strictly comparable with the mortality figures quoted by Hutchison *et al*.

We would agree with the view expressed in your leading article that measures directed towards the relief of hypoxia have more effect in lowering mortality in the respiratory distress syndrome than correction of metabolic acidosis alone.—We are, etc.,

SIR,—I was interested to read Dr. J. M. Abraham's and Dr. R. J. K. Brown's article (9 September, p. 640) dealing with bicarbonate administration in the respiratory distress syndrome.

I have two comments to make regarding the treatment of respiratory distress syndrome from my own experience in the special care nursery, Royal Victoria Hospital, Belfast, over the past two or three years. In my experience oral sodium bicarbonate 8.4% may worsen and increase the difficulties in respiration in the very small premature baby, as it causes marked gastric distension with consequent embarrassment of chest expansion, making the infant's labours even more difficult, and for this reason I have not used this method.

Secondly, I have found that the umbilical vein is simple to use and is the least traumatic method for administering intravenous fluids to the small infant, and from my own experience phlebothrombosis has occurred only once during many dozens of catheterizations. Using this route for intravenous fluids the infant is not subjected to repeated trauma of scalp vein infusions that may counteract any good effect obtained from the possible correction of the metabolic acidosis with the bicarbonate. Therefore I feel that this factor may account for the increased mortality in Dr. Abraham's and Dr. Brown's group given intravenous scalp vein fluids.—I am, etc.,

Problem of Unused Drugs

SIR,—I was interested to read the article "Collection of Unwanted Drugs from Private Homes" by Dr. W. A. Nicholson (16 September, p. 730). It is extremely difficult for each individual practitioner to gain any control over this mounting problem. However, I think it is worth mentioning an extremely simple technique which gives the doctor a small measure of control in some cases and which I am surprised is not used by many of my colleagues. Quite simply, each patient is asked to bring his supply of medicines with him to each consultation. A great number of patients are willing to co-operate in this way and the prescriber is thus enabled to determine the number of doses required until the next visit.

Using this method, it is surprising how often one meets the patient who says he is taking his tablets regularly but who in fact brings stock bottles which indicate the contrary. This discrepancy can be used as a valuable discussion point about the role which the medicaments are playing in the patient's life and the treatment of his illness. In addition, when he sees all the medicines together, the doctor is reminded of the complex regimen he sometimes asks a patient to undertake and can adjust his prescribing habits accordingly.

I realize that a determined saver of tablets for suicidal purposes will not be influenced by such a system, but I think that quite a number of patients can be spared the risk of having large quantities of dangerous chemicals in their households.—I am, etc.,

London S.E.5.
J. C. GUNN.

SIR,—Being involved as a medical officer of health member of a home safety committee which is currently considering a scheme for the recovery of unwanted drugs, I was particularly interested in the paper by Dr. W. A. Nicholson (16 September, p. 730) on the Hartlepool scheme for this service. However, one aspect which is causing my home safety committee much thought is the method of disposal of the drugs once they are collected. They would normally be brought in to pharmacists, who in turn would be required to devise their own means of disposal or to organize central disposal such as at a hospital. It is generally agreed that neither the refuse collection service nor the public sewers ought to be used. Incineration, either by the pharmacists or by a hospital, could involve some danger.

Would Dr. Nicholson or Dr. Milligan, the medical officer of health, please indicate in your correspondence columns what method of ultimate disposal is used in Hartlepool? This information may be of value to others besides my own committee.—I am, etc.,

Penicillin Encephalopathy

SIR,—Your leading article on this subject (12 August, p. 384) contains the following statement. "And if, as it seems, penicillin G is particularly apt to produce such an encephalopathy, other antibiotics might be considered as first choice in treatment." Since the patients to whom your article refers were all in a state of renal failure, and since the dosage of penicillin G exceeded 25 million units per day, I would like to know what antibiotics you have in mind that can be given more safely, in comparable doses, to uraemic patients The semi-synthetic penicillin and the cephalosporins are not usually less toxic than penicillin G, while most other antibiotics are highly toxic or lethal in such subjects in much lower doses.

The doses mentioned (25–40 million units daily) correspond to amounts of 14 g. per day or more of penicillin G intravenously. At this level plasma concentrations reach 50 mg./100 ml. even in normal subjects, and are much higher in patients with bilateral nephrectomy, azotaemia, and other conditions referred to in the article. The remarkable fact is not that penicillin G causes temporary encephalopathy, but that it can be given at all to such patients in such dosage.

Penicillin G and its simpler semi-synthetic derivatives are among the least toxic of all drugs, being well-tolerated by mammalian tissues in concentrations far exceeding those of many physiological substances. There is evidence,[1] however, that penicillins in solution can polymerize as well as degrade, and it seems possible that some untoward effect might be attributable to these changes, which are minimized if solutions of the purified drugs for injection are used fresh, well within the stated date of expiry.—I am, etc.,

Visual Hallucinations in Cranial Arteritis

SIR,—With reference to the communication of Mr. C. T. Hart (9 September, p. 643) it may be of interest that in my own personal series of some 67 cases of giant-celled arteritis of the aged (which name, despite opposition, I still consider preferable) there have been three in whom formed visual hallucinations were a prominent symptom, and it would seem that this symptom may not be a particularly uncommon characteristic of what is fundamentally an extremely pleomorphic condition.

None of these patients developed signs related to the external visual apparatus, possibly owing to the institution of early treatment. One in particular was most striking, being an 85-year-old retired headmistress in a very good state of mental preservation who was extremely distressed by the continuous appearance of men's faces. These faces were not of people personally known to her but of famous historical figures such as Darwin, Browning, and Thomas Arnold. In yet another case the figure of a rabbit was constantly present. There seems little doubt that these phenomena do arise from an irritative involvement by the arterial process of appropriate cortical areas.

A perhaps significant comment on this particular symptom is that I am aware of at least one case of my own and two others reported by colleagues where the condition occurred in inmates of a mental institution, and the symptomatology had been related to their mental condition rather than to this disease. The importance of this in relation to the prevention of the blindness which may supervene in a third of these cases need not be elaborated.

I would like to question the validity of the very common use of the word "euphoria" in relation to the attitude of these patients to their condition. It would seem to me that this is not really an accurate description of the total unconcern which so many of them display, and one has been seriously tempted to wonder whether this quite remarkable lack of concern may not be explained, in a teleological sense, as a desirable outcome of what at least a considerable number of people would regard as a stress disease *par excellence*.

The importance of this latter feature in relation to the problem of the diagnosis of this condition is well outlined by a patient of my colleague Mr. D. St. Clair Roberts. This was an old lady, who, although patently suffering from giant-celled arteritis of the aged, steadfastly refused to admit to having any pain until the day following commencement of treatment with systemic steroids, when her gratitude at having been relieved of an excruciating headache knew no bounds.—I am, etc.,

Sussex Eye Hospital,
Brighton, Sussex.

M. J. GILKES.

Prophylaxis in Haemophilic Arthropathy

SIR,—Prophylaxis with bank plasma in Christmas disease has not been generally used, and, as severe haemophilic arthropathy is a crippling disease, the favourable results achieved with five years' such treatment are worth reporting.

A 40-year-old male has been a known "bleeder" since childhood and a semi-invalid from the age of 16 years. When well his general physical fitness helped to prevent haemarthroses, but a period of recumbency tended to produce a vicious circle, because muscular flabbiness would lead to more easy recurrence of haemarthrosis as soon as he was ambulant again. General examination was normal except for deformity of the joints, especially the ankles. Christmas disease was diagnosed.

In 1962 it was decided to start him on long-term prophylaxis with bank plasma, and he has received a standard infusion of 2 units (500 ml.) weekly. This has been increased to 3 units (750 ml.) or occasionally 4 units (1,000 ml.) on those occasions when a breakthrough haemarthrosis developed. Altogether there have been eight occasions during the five years when slight to moderate haemarthrosis developed. This usually happened on the sixth or seventh post-infusion day, though on one occasion it occurred on the first postinfusion day. Each time it responded rapidly to an infusion of bank plasma.

He has had urticaria several times which responded satisfactorily to oral promethazine. After three years of treatment (and 80 litres of plasma) he developed acute hepatitis—assumed to be homologous serum jaundice—from which he made an uneventful recovery. This risk is not inconsiderable but is one most patients would accept for the chance to escape the painful round of haemarthrosis and immobility.

Factor IX assays are consistently 0% on the seventh postinfusion day, and he has an average rise of 5% of Factor IX after an infusion of 500 ml. of bank plasma. The half-life of Factor IX is taken to be 24 hours.[1] Assuming an initial concentration of Factor IX of 5%, he should have no more than 0.04% remaining after seven days, and it is remarkable that so little should protect him from further bleeding. Biggs and Macfarlane state that "trivial haemorrhage in Christmas disease may be prevented by as little as 1% of Factor IX," and they refer to one patient whose whole blood-clotting time was still very much shortened three weeks after receiving two litres of plasma.

A recent assay for inhibitors of Factor IX was negative. The danger of inhibitor production seems to be slight in Christmas disease, and a search of the literature has produced reports of only 13 cases.[2-4] Christmas disease is therefore more suitable than classical haemophilia for prophylaxis because of the longer half-life and the more potent effect of low concentrations of the factor, as well as because of the low likelihood of the formation of inhibitors.[1]

At least in this patient bank plasma has proved satisfactory. This plasma is deep-frozen at −18° C. at Groote Schuur Hospital. The average age of a unit was six weeks, with extremes of three weeks to three months. Geratz and Graham[5] have shown that almost normal quantities of Factor IX are present in plasma after six months at this temperature. There has been only one occasion following about 250 infusions when there was evidently insufficient Factor IX in the plasma used, as the patient developed a haemarthrosis on the following day.

This patient has progressed to a nearly normal existence, and the favourable results in his case suggest that the treatment deserves a wider trial.

I would like to thank Dr. R. Sougin-Mibashan for help in the preparation of this paper, and the Medical Superintendent, Groote Schuur Hospital, for permission to publish.

—I am, etc.,

Department of Medicine,
Groote Schuur Hospital,
South Africa.

Early Discharge of Maternity Patients

SIR,—The leading article and papers on early discharge of maternity patients (26 August, pp. 508, 517, 520), also the letter by Dr. S. E. Browne (16 September, p. 739) contain no reference to reduction of perinatal mortality that can result from practising early discharge.

More beds being made available, a "noticeable fall in perinatal mortality" resulted from admitting more antenatal cases[1] and by increasing the number of hospital confinements.[2]—I am, etc.,

Mayday Hospital,
Thornton Heath.

ARTHUR CLIFT.

Thrombosis and the "Pill"

SIR,—I was interested to see that the reliability of the Medical Research Council report had come under scrutiny (19 August, p. 493), for, as you know, I have doubted any specific chemical connexion between the pill and blood agglutination ever since the suggestion was first mooted.[1]

As one who spends his entire working day dealing with varicose veins, phlebitis, and deep-vein thrombosis, it does seem to me that one vital piece of information was omitted from the Medical Research Council statistics —namely, did the women on the "pill" who suffered lower limb venous sequelae also have prior varicose veins? As I understand the report, the first study, organized by the Royal College of General Practitioners, compared non-pregnant women of child bearing age who were not taking the "pill" with equivalent women who were taking the "pill" and with women of the same age group who were either pregnant or puerperal, reaching the conclusion that the second and third groups were respectively three and six times more likely to develop phlebitis than their non-pregnant non-"pill"-taking counterparts.

Now it is common knowledge that pregnant women with varicose veins are far more likely to develop pre- or post-gestational phlebitis than those without. It is also known that the commonest cause of phlebitis in men or women at any age is varicose veins. Surely, therefore, the determination of the presence or absence of varices should have been a vital and significant part of the investigation of all three groups, particularly those taking the "pill."

Assuming for the moment, however, that had this information been available it would have demonstrated that the presence of varicose veins was almost a *sine qua non* in those of any group who developed phlebitis, how are we to explain the small but significant increase among those taking the pill? Here again we need look no further than our everyday knowledge of the onset of phlebitis in persons with varicose veins —namely, that the commonest precipitating cause is a diminution in ambulation. We all know the classical example of the active woman whose large varicose veins give her no trouble at all until she retires to bed with influenza or a "disc" and is smitten with phlebitis five days later. But it does not need complete immobilization to lead to phlebitis. Any significant diminution in ambulation can reduce calf-muscle pump action enough to dam back venous return in varicose veins and produce clotting. And for evidence that this can happen we need look no further than your most recent leading article "Which Pill?" (9 September, p. 627), in which you, Sir, state quite categorically that the oestrogenically loaded pill "will produce symptoms such as . . . oedema, tiredness, troublesome varicose veins. . . ."

Summing up, therefore, I would suggest that the connexion between the "pill" and phlebitis, such as it is, is a purely mechanical one, and that the re-examination of the statistical material will show that the women on the "pill" who develop phlebitis are those who have varicose veins and are taking a "pill" with too high an oestrogen content.—I am, etc.,

London N.W.1. STANLEY RIVLIN.

SIR,—We would like to record a case of phlebothrombosis and pulmonary embolism occurring in a patient taking an oral contraceptive.

A lady of 30 years was admitted as an emergency to this hospital with a sudden history of shortness of breath for five days. Two days prior to this she had noticed swelling of the ankles, the right side more than the left. She has been on Lyndiol 2.5 (lynoestrenol 2.5 mg. and mestranol 0.075 mg.) over the last nine months and during this period she had put on 28 lb. (13 kg.) in weight. At the time of admission she had definite signs of phlebothrombosis of the right leg, and, although there were no clinical signs on examination of her chest, a chest *x*-ray showed an opacity in the right lower zone with elevation of the right diaphragm and slight prominence of the right pulmonary artery compatible with the diagnosis of pulmonary embolism. An E.C.G. provided contributory evidence, showing an S in lead 1 and a Q with inverted T in lead 3. There was no evidence of any infection, and her Hb, E.S.R., W.B.C., and differential counts were normal. Her S.G.O.T. and S.H.B.D. were normal and the liver-function tests were normal except for a raised S.G.P.T. of 66 units/ml. (normal in our laboratory 4–38 units/ml.). She was treated with anticoagulants and with this the signs of phlebothrombosis cleared up completely and a subsequent chest *x*-ray was within normal limits.

Although a number of cases have been reported of a similar nature in patients on oral contraceptives, this case raises an interesting point because of the great increase in weight starting when the patient was put on oral contraceptives. We are wondering whether this increase in weight played a contributory part in the development of the phlebothrombosis and subsequent pulmonary embolism.

This case also shows slightly abnormal liver-function tests. Similar instances of raised serum enzymes were reported by Stoll *et al.*[1] in menopausal women on Lyndiol even without any frank jaundice. Thulin and Nermark[2] mention a report of abnormal liver-function tests in young women on oral contraceptives, but mostly with only slightly increased value. It is possible that raised S.G.P.T. could be due to Lyndiol.

This case has been reported to the Dunlop Committee.—We are, etc.,

Human Infection with Porcine Ascaris

SIR,—A male child aged 14 months developed diarrhoea, with green stools during the third and fourth days of the illness, and on the sixth day passed a worm $4\frac{1}{2}$ in. (11 cm.) long, which was identified as an immature female *Ascaris*. The child was treated with a single dose of 7.5 g. Pripsen (piperazine phosphate, *B.P.*, and standardized senna, Westminster Laboratories Ltd.) the same evening, and during the night passed a further eight worms, all of which were identified as immature *Ascaris*. The worms ranged in size from $3\frac{1}{2}$ in. to $5\frac{3}{4}$ in. (9–15 cm.), and all but two were females. The Pripsen treatment was repeated three weeks later, and again nine weeks later, but no more worms were passed.

The child had never been away from his home in the Brentwood area, and had been confined exclusively to the house and garden. During the early spring, pig manure, purchased in bulk from a local supplier, had been spread on the garden. Several weeks later, about six weeks before the worms were passed, the child had been seen in the garden with a small piece of the manure in his mouth. Subsequent microscopic examination of a sample of manure from the same site revealed the presence of fully embryonated *Ascaris* eggs. Some of these eggs were given orally to albino mice. Immature *Ascaris* were found in the livers of each of the mice several days later, which confirmed that the eggs were infective.

It is concluded that there is strong circumstantial evidence that the child became infected by ingesting *Ascaris* eggs from the pig manure. Unfortunately the unequivocal differentiation of human and porcine *Ascaris* species on morphological grounds is very difficult, if not impossible, especially in the case of immature worms. Cameron[1] considered that infection of man with *Ascaris* of porcine origin was undoubtedly possible, and that a study of this problem was far from academic. He also suggested that in an unusual host *Ascaris* larvae might have a greater pathogenicity than in the normal host.

Since *Ascaris suum* Goeze, 1782, is still a common infection in pigs, it is suggested that the use of pig manure in gardens is a potential health hazard, especially to young children.—We are, etc.,

Chromosomes in Hodgkin's Disease

SIR,—In our paper "Lymphocyte Transformation and Chromosome Studies in Hodgkin's Disease" (16 September, p. 704) we drew attention to the exaggeration of the secondary constrictions in C9 chromosomes observed in some peripheral blood lymphocyte cultures in our patients. Since the paper was submitted it has come to our notice that Nusbacher *et al.*[1] have observed, in addition to a high percentage of chromosome breakage, attenuation of secondary constrictions in cultures of lymphocytes from 1-year-old children with congenital rubella. There is thus evidence that in-vivo viral infection is one of the factors affecting the appearance of secondary constrictions in cultured cells. Nusbacher *et al.* also observed end-to-end association of chromosomes, which was another occasional feature of the metaphase plates of patients in our series. Thus it is possible that the peculiarity of the chromosomes which we observed in Hodgkin's disease could be due to the presence of viral infection in some of the patients.—We are, etc.,

Medicine in Burma

SIR,—Lest misunderstanding should arise from Sir George McRobert's admirable letter concerning Burma (9 September, p. 677), I wish to emphasize that in my article I wrote that the Burmese decided "to leave the Commonwealth, and, as a corollary to this, to render themselves ineligible for aid extended to Commonwealth countries." I neither stated nor implied that they rendered themselves ineligible for aid extended to non-Commonwealth countries. Such aid has in fact been small in comparison with that given to Commonwealth countries. Thus, for example, the latest figures available from the statistical department of the Ministry of Overseas Development show that to the following countries total technical aid from Government sources given during 1965–6 amounts to:

Nigeria	£3,069,200
Uganda	£5,203,400
Tanzania	£4,383,400
Kenya	£7,453,200
Burma	£ 250,300

The three East African countries have populations very much smaller than Burma; the populations of Nigeria and Burma are roughly comparable in size; all have received aid 12 to 30 times greater than Burma over this period.

I tried particularly to bring out the point that with limited aid Burma had done much. Figures of this kind emphasize the achievement and the admiration due to them, an achievement which when aid is considered on a per caput basis appears even more spectacular.—I am, etc.,

Anxiety State after "Sex Education"

SIR,—A 10-year-old boy known to me for most of his life returned home from his excellent boarding-school, which he would not give up for the best garden railway in the world. The relaxation of his own territory uncovered a distressing condition of general malaise, irritability, nightmares, fears of oncoming traffic, worry about smells, the compulsion to make sexual innuendos, and the awkward behaviour of the very guilty, all pointing to this boy's having been assaulted sexually by an older person probably in authority. Subtle examination—and I have examined children and delinquents since 1941—revealed that no actual assault had taken place, only what this deep-feeling child had interpreted as an assault. He had been submitted, along with his classmates, to a course of instruction from his well-intentioned headmaster on body mechanics, including copulation, "fully illustrated in colour."

This child has always been quick to see the reality behind the symbol and the meaning underlying everything. So now, alerted to the magnitude of the sex act, he found, as it were, that he was armed with a seemingly automatic weapon the control of which was beyond him but for which he would be held responsible. Intercourse with his one permanent and reliable authority (his mother; he has no father) he found impossible, for that act and word had now a sexual connotation. And he found himself party to a sexual experience that was illicit because it was without the knowledge and sanction of his authority. He had therefore three reasons for developing this anxiety state.

This child's very ill condition was recognized and duly treated because of his social connexion with me, a child psychiatrist. Other children's psychiatric states can be passed off as "a phase" which will heal sooner or later with defect, leaving a lasting personal scar. I therefore feel bound to call the attention of my colleagues, especially those concerned with mental health and the health of schoolchildren, to this fresh cause of psychiatric states in the young, the giving of "sex education" (the internal details of the male and female animal, the mechanisms of mating, foetal development, and delivery) to persons in a defenceless position in a class situation before they are sufficiently mature to face these stark, staring realities.—I am, etc.,

Selly Oak Hospital,
Birmingham.

Occupation, Chemicals, and Cancer

SIR,—In a leading article commenting on an excellent article by Dr. Georgiana Bonser (10 June, pp. 649 and 655) you attribute to me a statement which I never made and do not support. You state that I "advocated that evidence of carcinogenic hazard should be clear-cut, and a solution should be available before pressure is put on manufacturers to reduce the exposure of their employees." What in fact I did say was, "Until the data are clear-cut and a solution has been found —i.e., either control of the material or its elimination—*publicity* through newspapers, congressional committees, or other types of *non-scientific* releases can hope to accomplish no useful objective." (My italics.)

Where an adequate occupational health team exists, and this includes both a knowledgeable physician and industrial hygienist, measures can be taken to minimize or eliminate exposures even before a situation is fully understood. In fact in my experience an outmoded plant was once dismantled by a company even before the cause of an occupational cancer was fully understood—obviously eliminating exposure. This was on the recommendation of such an occupational health team. Where such a team does not exist within an industry it can be made available to the industry through Government or consultants. Obviously if an industry, through financial greed, fear of litigation, inertia, or plain laziness, fails to obtain or heed the advice of such consultants, or the Government, additional pressures may have to be brought to bear upon the management, but this can be done through established mechanisms, not through publicity.

Even Dr. Bonser quotes Leitch[1] as follows: "The solution of the problem [of dye-workers' bladder cancer] would be welcome, for until the particular noxious substance or group of substances is known no real measures can be taken to prevent dyeworkers' cancer." Such a solution is arrived at through careful, quiet, competent research, such as has been described by Dr. Bonser, not through raucous publicity in non-scientific channels. I personally have found industrial management easy to convince once the facts are known, but extremely difficult to convince when the facts are unclear or unknown. I personally do not consider this a shortcoming.—I am, etc.,

R. E. ECKARDT.

Second British Academic Conference in Otolaryngology

SIR,—May I be permitted, please, to correct the misunderstanding likely to have arisen from what you printed of your special correspondent's account of the Second British Academic Conference in Otolaryngology under the heading Otolaryngology Conference (26 August, p. 555)? It is true that two half-days of this important four-day meeting were given over to the Sections of Laryngology and Otology of the Royal Society of Medicine for their combined summer meeting and that the presidents of these sections, Mr. T. G. Wilson and Mr. Maxwell Ellis respectively, took the chair at the plenary sessions on the Friday and Thursday mornings, but I cannot believe that Mr. Wilson would wish to pose as "the president of the meeting," which was in fact presided over with characteristic proficiency by the Master, Sir Terence Cawthorne.

I am aware also that your special correspondent was asked to report particularly on the symposia entitled Facial Paralysis, the Catarrhal Child, and the Present Position of Chemotherapy in Head and Neck Cancer. Nevertheless, anyone not there would never guess from the report that these were only three of the forty topics that constituted this part of the scientific programme. There were also an almost continuous display of scientific films, a large area given over to exhibitions, and a very full and varied social programme. The editor of the *Journal of Laryngology and Otology* has generously agreed to make available one-half of the November issue of the journal for an account of this landmark in the history of British otolaryngology, and those of your readers who wish to obtain a correct impression of what took place in Oxford from 30 July to 4 August may care to look out for it.—I am, etc.,

L. F. W. SALMON,
Hon. General Secretary,
The Second British Academic Conference
in Otolaryngology.

Delayed Death in Imipramine Poisoning

SIR,—Dr. C. M. Steel and his colleagues (9 September, p. 663) in their article on imipramine and amitriptyline poisoning in children refer to two noteworthy cases where sudden collapse and death occurred after periods of progressive clinical improvement. The following case, where death occurred after apparent recovery from an overdose of imipramine, may be of interest.

A woman aged 49 was admitted to hospital on 17 March 1967 at 12.10 p.m. She had been taking imipramine intermittently for recurrent depression, and had apparently taken an overdose the night before—two empty bottles were found near the bed after the husband had been unable to rouse her. On admission she was deeply unconscious and unresponsive to painful stimuli. The stomach was washed out and 10 mg. of bemegride given intravenously. During the first hour after admission to the ward the patient had two major epileptic fits, and the level of unconsciousness became deeper. Temperature, pulse, respiratory rate, and blood pressure were within normal limits at this time. Frusemide 40 mg. was given intravenously and 500 ml. of mannitol was transfused during the next two hours. This was followed by 1,000 ml. of normal saline. The patient had five more epileptic fits in the next six hours, and at 8.30 p.m. she started to recover consciousness. At 9.30 p.m. she was reported to be very restless and trying to get out of bed. The intravenous drip was kept running and a further 1,000 ml. of normal saline was transfused.

Throughout the next 96 hours she remained fully conscious, but was confused, restless, and uncooperative most of the time. There were, however, brief periods when the patient was quiet, co-operative, and completely rational. Paraldehyde and chlorpromazine hydrochloride by intramuscular injection seemed to be producing adequate sedation, but on 21 March she became increasingly confused, agitated, and unmanageable. Her speech showed flight of ideas and her mood was somewhat elated, the picture being typical of a state of mania. At 9 p.m. she became semicomatose and her axillary temperature went up to 105° F. At 11 p.m. the level of consciousness deteriorated, the temperature remained elevated, and generalized muscular twitchings were observed. Three hours later the patient had a sudden cardiac arrest.

On post-mortem examination the leptomeninges on the cerebral surfaces were intensely congested and contained haemorrhages. There were numerous petechial haemorrhages on the subpleural surfaces of both lungs, with massive haemorrhages on the subpleural surfaces of the left lower lobe and right middle lobe. On section both lungs showed typical acute bronchopneumonia. The heart was congested, with haemorrhages in the muscle substance and in the visceral and parietal pericardium. The stomach mucosa was congested and contained semi-solid yellowish material but no evidence of tablets or capsules. The pancreas, spleen, and adrenal glands were congested. The kidneys were red and intensely haemorrhagic, and the bladder showed acute cystitis. Imipramine was detected in the following quantities—stomach contents 3.0 mg./100 ml., liver 4.7 mg./100 g., kidneys 2.8 mg./100 g., and blood a trace.

Previously an uninterrupted recovery could confidently have been expected in this type of poisoning once the patient had regained consciousness. This case would suggest that relapse and sudden death may occur in poisoning by tricyclic antidepressant compounds after apparent recovery. The forced diuresis may have kept the patient alive initially and there could be an argument for continuing this treatment in order to wash out the possible second wave of metabolites, which would otherwise contribute to an unexpected relapse.

I should like to thank H.M. Coroner and Dr. A. A. Miller for permission to describe the post-mortem findings, and Dr. C. Maxwell, of Geigy Pharmaceutical Limited, for helpful advice.

—I am, etc.,

A. B. MASTERS.

Whittingham Hospital,
Preston, Lancs.

Oculogyric Crises after Phenothiazines

SIR,—In view of the reports of bizarre neurological disturbances following treatment with perphenazine (Fentazin) from Drs. D. A. Heath and J. M. McGarry (11 February, p. 363) and Dr. J. R. Harries (22 July, p. 241) we should like to summarize briefly our experience with eight similar cases which have been seen in the last year. The patients have mainly been young adults, their ages ranging from 14 to 50 years with an average of 23 years. In four cases reactions have followed a single 5-mg. intramuscular injection given as premedication or postoperatively for vomiting. Symptoms have begun abruptly from 18 to 36 hours after the onset of treatment, and in none of our patients has this type of reaction been seen as a complication of long-term therapy.

Spasms of the head and neck occurred, most commonly with twitching, neck retraction, risus sardonicus, and oculogyric crises. These spasms were associated with curious subjective feelings of stiffness and immobility of the tongue with difficulties in chewing and swallowing, which occasionally preceded the more dramatic spasms by a few hours. Opisthotonos, flexion, and extension spasms of the limbs with a *main d'accoucheur* deformity were seen in the more severely affected. All patients remained completely alert mentally but were unable to modify their movements in any way. The attacks subsided spontaneously or in a few hours, with or without mild sedation. We have not used benztropine (Cogentin), which Ayd[1] has found to give rapid relief.

We feel that, although these neurological complications are not uncommon, they are as yet poorly recognized, and our cases have presented with a wide range of provisional diagnoses, including tetanus, tetany, epilepsy, and hysteria. Our experience confirms the finding of Kinross-Wright[2] that young people are unduly susceptible to these dystonic and dyskinetic reactions and we would advise caution in the use of this drug parenterally in this age group.—We are, etc.,

E. C. B. KEAT.

Case of Diarrhoea and Goitre

SIR,—I was fascinated by the report in the Clinicopathological Conference of the above case (29 July, p. 293), but, as a surgeon, I would like to have seen some remark to the effect that the patient had been offered an operation to remove the thyroid nodule discovered in 1960.

I have recently seen a young woman with a small lump in the neck which I thought might be a carotid body tumour. Three years before she was told by two practitioners in England that the lump was nothing to worry about. I referred her to South Africa, where the lump was found to be a metastasis from a thyroid carcinoma. At subsequent hemithyroidectomy and block dissection involved nodes were found to extend into the superior mediastinum.

We are used to rural Africans refusing operations until their tumours become inoperable, but it is alarming to find doctors not pressing for the histological diagnosis of "innocent" lumps which their patients bring to their notice.—I am, etc.,

IAN KENNEDY.

Mercury Perchloride in Surgery

SIR,—In a letter (9 September, p. 679) Mr. H. B. Devlin discussed the use of 1:500 mercuric perchloride solution in large-bowel surgery. He concluded that it was a safe anticancer agent when used as described by Goligher *et al.*[1] There have been no reported cases of mercury poisoning following the use of this solution in this manner. Keynes[2] has suggested that the solution may be too toxic to leave in the peritoneal cavity to prevent intraperitoneal seedlings of tumour, although he used a 1:500 solution for this purpose on one occasion without ill effect. We wish to report the following case to emphasize that mercuric perchloride is too dangerous to use in the peritoneal cavity.

A woman of 68 years with no pre-existing evidence of renal disease underwent an ovarian cystectomy on 2 May 1967 for what was subsequently shown to be a mucous cystadenoma. During the course of the operation, which was otherwise uneventful, the peritoneal cavity was irrigated with 250 ml. of a 1:500 solution of mercuric perchloride. It was not known whether the peritoneal cavity was mopped dry prior to closure. Immediately postoperatively the patient became severely oliguric, and was transferred to the Hammersmith Hospital on 8 May for treatment of an acute renal failure. On admission peritoneal dialysis was commenced, but, as this was unsatisfactory, a Scribner A-V fistula was inserted into the right forearm to facilitate haemodialysis with a Kolff twin-coil artificial kidney machine.

Ureteric obstruction was excluded by cystoscopy and bilateral retrograde pyelography. Intermittent haemodialysis was necessary on 19 occasions during the next two and a half months. After the first month her urine output gradually increased, and since her discharge on a 20-g. protein diet with moderate fluid restriction the blood urea has remained at 90 mg./100 ml. Her daily urine volume is approximately 800 ml., containing 6.5 g. of urea. On this regimen she is now leading an active life at home.

A specimen of urine taken one month after exposure to mercuric perchloride revealed a mercury content of 150 μg./litre. This figure is much lower than that sometimes observed in chronic mercurial poisoning, but it is known that there is no correlation between the urine mercury level and the degree of renal damage sustained. Indeed, the urine mercury concentration falls with the onset of renal tubular damage.

In view of our experience with this case, we advise that mercuric perchloride should not be used as an irrigating agent in the peritoneal cavity.

We are grateful to Mr. H. T. Delves, A.R.I.C., Institute of Child Health, London, for performing the urine assay for mercury.

Diagnostic Paracentesis

SIR,—I have been glad to note the growing interest in diagnostic abdominal paracentesis as evidenced by the articles of Morris[1] and Baker *et al.*[2] I now use it routinely in all abdominal diagnostic problems, including the patient with ascites of uncertain aetiology.[3] A film, cell count, and protein estimation are all simple procedures for a small laboratory and allow treatment or prognosis on a sure basis.

I am surprised that only "80% positive paracentesis can be expected in intraperitoneal haemorrhage."[2] I have found that a No. 1 needle on a 10-ml. or 20-ml. glass syringe, usually only into either lower quadrant, is quite adequate if the patient has been made to lie on the appropriate side, either before or after insertion of the needle. The needle is withdrawn slowly, the plunger under tension. It is often only as it seems the tap has been negative one obtained a small amount of fluid coming from a thin film on the peritoneum.

A negative paracentesis thus performed is now accepted as a contraindication to surgery for suspected ectopic pregnancy, especially when there is an associated sudden fall in Hb level. Two recent cases in this hospital were explored in spite of negative taps. They were found to be normal intrauterine pregnancies but associated with acute haemolytic crisis.—I am, etc.,

Headlight Glare

SIR,—Dazzling headlight glare we know is the cause of some of our road accidents at night. Dipped headlights are not 100% effective even if properly adjusted. The following solution is therefore offered for your consideration and comment.

Let us suppose that it was made compulsory to polarize headlights at 45° from the vertical, then if windscreens or sun visors or goggles or glasses were similarly polarized to 45° in the same plane one would not interfere with one's own headlight field, but light from on-coming cars would be cut out, since there would be a 90° rotation. Awareness of on-coming traffic may be achieved by using a polaroid material of suitable density and efficiency so that not all light is stopped. Fog light would be exempt.

If headlight adaptation is made compulsory it leaves the choice of selecting the method of cut-out to the individual driver, should he so desire. The most convenient but expensive way would be by incorporating the material between the layers of the windscreen during manufacture, but the alternatives mentioned above would be simpler and cheaper. Headlights may be adapted by using clip-on polaroid screens or by inserting them on the inside of the glass during assembly.—I am, etc.,

S. J. LINES.

Peterborough Memorial Hospital,
Peterborough, Northants.

where mutual confidence and responsibility do not exist, situations where no credit is to be found will arise.

The answer is, I maintain, in our own hands.—I am, etc.,

NOEL CASH,
Hon. Secretary, Kettering Division B.M.A.
Desborough,
Northants.

Doctoring the Unattractive Areas

SIR,—An unattractive area is one where the number of applicants for a practice vacancy is consistently low. The reasons for this state of affairs are varied, and include high morbidity, above-average number of items of service per patient, educational and recreational deficiencies of the area, poor accessibility to London or other cities, a reduced number of general practitioners in the area, their above-average age, and high average list size.

The defining of an area is frequently done by the young general practitioner's wife, and was not so acute when doctors married after starting in practice. The problem has to be solved and the obvious methods are by attraction or direction. We despise the one and fear the other. If there were too many general practitioners chasing too few jobs there would be no problem, but it is pretty certain that any increase in numbers of available general practitioners would lead to the advocating of reduced lists in attractive areas and not to the manning of unattractive areas. We are duty-bound to help our fellow practitioners and should not stand by merely watching the increasing work load and incidence of coronary disease among our colleagues.

A possible solution to the problem is that service in unattractive areas would count as time and a half for superannuation purposes. Capitation fees could be raised according to morbidity and "doctor demand" rate. It is no fault of today's doctor if the patients were spoilt yesterday. Health centres could be built with living accommodation for the duty doctor. By grouping practices the general practitioner could be on duty only one week-end a month and not more than two nights a week. He should be allowed to live up to seven miles from his practice, and in winter months use the health centre flat when "on call." There should be ample clinical-assistant posts and a brake put on the closure of the local hospitals in such areas. The Ministry could inaugurate a scholarship fund for the education of doctors' children from unattractive areas.

We as custodians of the nation's health must not evade our responsibility. There is a solution and we must implement it. If we cannot alter the geography of the difficult areas the Ministry could set the medical scene, arrange the conditions and remuneration, and then advertise the vacancies.—I am, etc,

Caerphilly,
Glam.

G. MURRAY JONES.

Financing the Health Service

SIR,—£17,000,000 is a lot of money, yet it is the amount by which doctors' families are subsidizing the Health Service, I believe. It may not be understood how this is done.

> I am single-handed, in general practice, and employ, on contract through an agency, a dependant relative, for whom I pay £1,200 per annum. My accountant has recently agreed my last year's accounts, which include this figure, with the Revenue. Now, if 5,000 single-handed practices employ such relatives full time (secretary and receptionist, nights and week-ends as well) at, say, £1,000 per annum each, this would represent £5,000,000. Say 10,000 doctors employ dependant relatives part time (nights and week-ends only) at £500; this represents another £5,000,000. Add on to this another 5,000 doctors whose related staff are working on an occasional basis—odd nights and holidays, at £250 per annum, say; then one has £1,250,000, making an approximate total of nearly £12m., on which tax has in effect been "paid"; which at 8s. in the £ would add on something like £4,800,000 to make a grand total of from £16m. to £17m.

This all sounds very nice, but has anyone any evidence to support this proposition? Especially just now when our B.M.A. is about to present further ideas to the Review Body?—I am, etc.,

Bebington,
Cheshire.

ANTHONY YOUATT.

Consultants' Views of General Practitioners

SIR,—Mr. W. B. S. Crawford in his letter (16 September, p. 735) has pinpointed the essence of this problem, which is that generalizations by any section of the profession are tendentious in the extreme. That problems exist is not in doubt; the answer lies in understanding why they exist and in trying to rectify them.

In this area, for example, the relationship between consultants, junior hospital staff, and their general-practitioner colleagues is excellent. The reasons for this are not hard to find. The local hospital has grown out of a general-practitioner hospital, and many of the original staff are still in local practice. The consultants have been painstaking to leave intact the special relationship which has always existed between general practitioners and the hospital, and have built up a rapport, based on personal contact, which can be second to none. Furthermore, the weekly seminar, attended by senior and junior hospital staff and by a large number of general practitioners, is outstanding not only for its postgraduate benefits but because it is preceded by a luncheon at which a close social and clinical intercourse is established at all levels.

The local medical society acts in a similar fashion, encouraging this essential contact. A new Division of the B.M.A. has started promisingly, based on the hospital, and care has been taken to ensure a balance between hospital and general-practice appointment to the various offices. The domiciliary consultation is properly and extensively used—no small factor in the proper understanding of each other's problems. Last, but not least, the fact that general practitioners have full access to all the facilities for investigation ensures that a satisfactory clinical basis exists on which the general practitioners can build their standard of practice to a level at which, I believe, the local consultants do not feel that unnecessary work is "being dumped on the hospital service." With these points kept in mind it is difficult to see how, apart from sheer bigotry, a correct and mutually respecting relationship cannot be built up.

On the other hand, it is easy to see how, in an area where the general practitioners do not have full access to hospital facilities, where their lists are oversubscribed owing to the shortage of general practitioners, where contact with the hospital is not encouraged, where some members of the senior hospital staff are suffering from a combination of egotism and an overt sense of clinical superiority (however well founded), in areas

Sales Promotion

SIR,—As a medical representative for the past 23 years and now retired, I am well aware of the comments of Dr. J. R. Caldwell regarding the frequency of representatives' visits to general practitioners (16 September, p. 741). Personally I was never accused of calling too frequently.

Most pharmaceutical companies respect the recommendations of the A.B.P.I.—namely, that three or four visits during 12 months are adequate.

The representative is not entirely to blame, he is carrying out company policy. There is no reason for doctors to see representatives more frequently than they wish.

The remedy is simple: advise the representative of the call frequency acceptable to him and if this is exceeded refuse to interview, and advise the company that he has done this. It is only by so doing that the people responsible for sales promotion in the pharmaceutical industry will realize that the wishes of the medical profession must be respected.

In respect of mailings, a doctor can quite easily request his name to be erased from a specific company's list, or, further, from all pharmaceutical company lists.—I am, etc.,

Nottingham.

WILLIAM H. SIMS.

Obituary Notices

F. J. BENTLEY, M.D., F.R.C.P., D.P.H.

Dr. F. J. Bentley, a former senior medical officer to London County Council, died suddenly on 10 September. He was 67.

[Antonio Chacon

Francis Joseph Bentley was born in Middlesbrough, Yorkshire, on 28 December 1899. He was educated at Middlesbrough High School and Durham University, graduating M.B., B.S. in 1922, and taking the Conjoint diploma in the same year. He held early appointments as house-surgeon to Grey Turner and house-physician to Alfred Parkin at Royal Victoria Infirmary, Newcastle upon Tyne, after which he came to London and was appointed house-physician to Sir Robert Hutchison, Sir George Frederick Still, and Sir Hugh Thursfield, at the Hospital for Sick Children, Great Ormond Street. Subsequently, under Still's guidance, he worked for the Medical Research Council on acute rheumatism in childhood. In 1924 he proceeded M.D. and took the M.R.C.P. in 1925 while still working for the Medical Research Council. He then entered the tuberculosis service of the Metropolitan Asylums Board, and was appointed senior assistant medical officer at Grove Park Hospital. After taking the D.P.H. in 1928 he joined the public health service as an assistant county medical officer of health for Surrey. In 1920 he was appointed divisional medical officer at London County Council in the tuberculosis service. He did much work to improve this service in many ways, and during this period he made a critical assessment of the value of artificial pneumothorax therapy. His results were published by the Medical Research Council. This work provided both a necessary corrective to the use of the method in unsuitable cases and a plea for the wider employment of thoracic surgery. Shortly afterwards he was elected F.R.C.P. in 1937. During the second world war he continued his work at the County Hall, but inevitably with much widened duties. He was promoted to principal assistant medical officer, and then to senior medical officer.

In 1948 he was appointed physician superintendent at Highwood Hospital for Children, Brentwood, later becoming senior physician. Then began the most rewarding period of his career. Much research on pulmonary tuberculosis in childhood was carried out at Highwood. Together with his colleagues, S. Grzybowski and B. Benjamin, he produced his major work, *Tuberculosis in Childhood and Adolescence,* in 1954, which achieved a world-wide reputation.

The amount of time he devoted to his research did not deter him from maintaining an interest in clinical problems and undertaking regular teaching of postgraduates from the Institute of Diseases of the Chest and Great Ormond Street Hospital and undergraduates from the London Hospital and Guy's Hospital. Visitors came from many parts of the world to consult him, and many were internationally recognized as experts in this field. Dr. Bentley was a keen gardener, an excellent photographer, and an enthusiastic traveller abroad; and in his later years, in spite of poor health, he enjoyed croquet at Hurlingham. He loved the theatre, good books, and the company of his friends and family. By his death we have lost an eminent worker in the field of tuberculosis. He will, however, be remembered for his work particularly on tuberculosis in childhood.

We extend our sympathy to his widow and two daughters.—M. A. B.

K. F. D. WATERS, M.A., M.B., B.CH. F.R.C.S.ED.

Mr. K. F. D. Waters, a former consulting surgeon to the Chelsea group of hospitals, London, died on 12 September in St. Stephen's Hospital, Chelsea, after a series of illnesses which he had borne with much fortitude. He was 75.

Kenneth Fraser Darrell Waters was born on 2 July 1892, and obtained a first-class honours degree in physiology at Oxford in 1915. He undertook his clinical studies at St. Bartholomew's Hospital, graduating M.B., B.Ch. in 1918. After early house appointments at St. Bartholomew's Hospital and at the Radcliffe Infirmary, Oxford, in 1922 he came to the hospital, then known as the St. George's Union Infirmary, where he was to stay for so long and help to build it into a modern general hospital. In addition, he was involved in giving the hospital its present name—St. Stephen's. From his appointment until the second world war Mr. Waters was the only resident surgeon for a busy general hospital of 600 beds. Although there were a number of visiting surgeons, the main brunt of the surgical work during this period fell on him, and he became well known for his long operating lists, which were endured good-humouredly by the theatre staff because of his well-remembered "winning" smile. During this period Waters obtained his F.R.C.S.Ed. in 1931. In addition to coping with most of the general surgery, he also had to tackle gynaecological problems. During the war, although he had periods of ill-health himself, Mr. Waters played an extremely active part in keeping the hospital functioning normally. He was a patient during one of the bombing attacks that hit the hospital, and staff still remember his efforts to help the injured after a bomb had fallen on one of the ward blocks, killing a number of patients and staff.

After the war Darrell Waters continued to devote his considerable energies to developing the practice of surgery in the hospital, and pressed strongly for a new theatre suite. His efforts bore fruit when a complete twin operating-theatre suite was opened in 1952. He had been closely involved in the design, and the new facilities ranked among the best in London. Fifteen years afterwards the theatre suite continues to give excellent service, and is a testimony to the success of Darrell Waters in developing the sound surgical practice of the hospital. His skill in diagnosing children's conditions was especially well known, and his second marriage to the writer of children's stories, Miss Enid Blyton, was a happy union for the hospital, as Mr. and Mrs. Waters took a great interest in the children's ward, and arranged for murals of the characters from her books to be displayed there.

Mr. Waters retired from active practice in 1957. His energy and devotion in developing surgery at St. Stephen's are still well remembered, and he was a much-loved and respected patient at the hospital in recent years. Sympathy is extended to his widow, two daughters, and the rest of the family. —M. G. R.

I. GLUCK, M.D., D.P.M.

Dr. I Gluck, consulting psychiatrist at the Portman Clinic, London, died suddenly on 10 July. He was 52.

Imrich Gluck was born in Budapest on 12 December 1914. In his late adolescence he moved to Czechoslovakia, where he took up the study of medicine. However, he was forced to interrupt his studies in 1938, and shortly after the outbreak of the second world war he succeeded in escaping to France, where he joined the Czech forces and was eventually evacuated to England. He was enabled to complete his medical studies at Manchester, graduating M.D. in 1942, shortly afterwards joining the R.A.M.C. During the latter part of the war Dr. Gluck served in the front line in Belgium and Germany, and he was with the first British troops to enter Belsen. Meanwhile all the members of his family had lost their lives in Nazi-occupied Europe. Returning to England on demobilization in 1946, he turned to psychiatric work and psychoanalytic training, taking the D.P.M. in 1948. He became a full member of the British Psychoanalytical Society in 1955. After working in the department of psychiatry of Leeds Medical School, and at Shenley Hospital, Dr. Gluck joined the staff of the Cassel Hospital, Richmond. His creative mind led him to explore new problems and new methods of treatment. He realized the importance of helping mothers who had disturbed relations with their small children, and that the setting of the Cassel Hospital would allow treatment to be carried out without separating mother and child. The results of this work were published in a clinical paper, and illustrated in a film which aroused much interest. The last years of his life were devoted to private psychoanalytic practice and psychotherapeutic work at the Portman Clinic, London. The depth of his understanding, and his human sympathy, were greatly appreciated by his patients. His colleagues remember his readiness to help in difficult tasks, his keen sense of humour, and the warmth of his personality.

Dr. Gluck had a profound knowledge of music, and was a competent violinist. He could have reached a very high level in this field had he not chosen medicine as his first calling.

He married in 1960 Evelyn, daughter of Sir Edward Beddington-Behrens, who survives him with their daughter.—L. H. R.

F. S. BONUGLI, M.D., D.R.C.O.G.

Dr. F. S. Bonugli, consultant venereologist to the Northern Ireland Hospitals Authority, died suddenly on 28 August. After attending his clinic in Coleraine, County Londonderry, he was taken ill in his car, and died in Ballymoney Hospital. He was 54.

Frederick Silvester Bonugli was born in Larne on 28 June 1913. He was educated at the Methodist College, Belfast, where he played rugby for the school's first XV. He received his medical education at the Queen's University of Belfast, graduating M.B., B.Ch., B.A.O. in 1937. In 1939 he gained the diploma of the Royal College of Obstetricians and Gynaecologists after working in the Royal Maternity Hospital and the gynaecological wards of the Royal Victoria Hospital, Belfast. He served in the R.A.M.C. in the second world war, and after demobilization he proceeded to the degree of M.D. at Queen's University, Belfast, in 1946. In the meantime he had decided to specialize in the field of venereology. He was appointed to the venereal diseases department of the Royal Victoria Hospital in 1946, and in 1951 became a consultant venereologist to the Northern Ireland Hospitals Authority, with his main clinics at the Royal Victoria Hospital, Belfast, and Coleraine Hospital, County Londonderry, an appointment which he held at the time of his death. He was a clinical teacher in venereal diseases and a lecturer in venereal diseases in social and preventive medicine to the Queen's University medical school.

For many years he was a member of the Medical Society for the Study of Venereal Diseases, and a correspondent member of the American Venereal Diseases Association.

He is survived by his widow and two daughters, to whom we extend our sympathy. —J. S. McC.

P. T. HARPER, M.R.C.S., L.R.C.P.

Dr. P. T. Harper, formerly of the Fiji Medical Service, died on 21 August at his home in Chertsey, Surrey. He was 83.

Philip Thomas Harper, eleventh of the thirteen children of Dr. Joseph Harper, of Barnstaple, Devon, was born on 2 February 1884. He was educated at Blundell's School, Tiverton, and St. Thomas's Hospital, London, qualifying with the Conjoint diploma in 1908. He held the appointment of senior obstetric house-physician at St. Thomas's Hospital before going out to Fiji in 1910, when he began a distinguished career in the Fiji Medical Service. He was appointed district medical officer at Ra and at Nadi, and in 1911 became resident medical officer at the Colonial Hospital, Suva. During the same year he married Miss Winifred Coster, a qualified nurse and midwife in the service of the Fiji Government. During the first world war he was commissioned as a captain in the New Zealand Medical Corps.

After demobilization he resumed his work in Fiji, and in 1920 became medical superintendent at the Leper Station, Makogai, playing an important part in advances in the treatment and management of this disease. During this period of three years he lived with his wife and small children at the station. He became medical superintendent of the new Colonial War Memorial Hospital at Suva, taking an active part in medical education and in the development of the hospital and medical services in Fiji until his retirement in 1938, when he returned to England. When the second world war broke out he volunteered again, and served in Egypt and later at Millbank Hospital, London.

He is survived by his widow and three daughters; his only son was killed in action with the R.A.F. in 1940.—R. H.

L. MURIEL RHODES-CLOONEY
M.B., B.S., D.A.

Dr. L. Muriel Rhodes-Clooney, a medical practitioner at Bexhill-on-Sea, died on 3 September. She was 67.

Laura Muriel Rhodes-Clooney, the youngest daughter of the late Canon A. H. Rhodes, of Cheltenham, was born on 24 September 1899, and was educated at Wycombe Abbey School, where she obtained one of the first medical scholarships. She received her medical training at the Royal Free Hospital and St. Mary's Hospital, London, qualifying with the Conjoint diploma in 1924, and graduating M.B., B.S. the following year. She held house appointments at St. Mary's Hospital, and afterwards became the first woman doctor to practise in Bexhill. She was also appointed medical officer to the infant welfare clinic in 1928, where she continued until April of this year. She did much pioneer work in the Bexhill maternity and child welfare clinics in the early days of their inception. Dr. Rhodes-Clooney was lecturer to the Bexhill Red Cross until after the second world war, and during the war was appointed to the Emergency Medical Service as anaesthetist in Bexhill and Hastings. She took the diploma in anaesthetics in 1944, and in 1948, when the National Health Service was formed, became part-time anaesthetist to the Hastings hospital group. In 1958–9 she was chairman of the Hastings Division of the British Medical Association. She retired from general practice in the National Health Service in October of last year, but continued in private practice until her death.

A keen sportswoman, Muriel Rhodes-Clooney played lacrosse for the University of London and county of Middlesex in her younger years, and was an active member of the Highwoods golf club up to the time of her death. She will be very much missed in Bexhill, and there are many who will look back in gratitude for all that she did.—T. K. B.

S. PORTERFIELD, B.A., M.B., CH.B.
B.A.O.

Dr. S. Porterfield, a general practitioner in Widnes for over 30 years, died at his home in Portstewart on 31 August. He was 87.

Samuel Porterfield, who came from Ballylennon, Co. Donegal, was born on 12 May 1880, and was one of a talented band of medical students who came north from Queen's College, Galway, to Queen's College, Belfast, for the last two years of their course. He graduated B.A., and M.B., Ch.B., B.A.O. in 1905 at the old Royal University of Ireland. For a time he was demonstrator of anatomy at Galway. Most of his career, after assistantships in Maesteg and South Emsall, was spent in Widnes, near Liverpool, a Lancashire town in those days famed for smoke and fumes. In 1914 he married Lilian Gourley, from Carnshanna, and joined her uncle, Dr. McCausland, in Widnes. He worked single-handed in the large practice during the first world war and gave enthusiastic support to the St. John Ambulance Brigade as a lecturer and examiner. Dr. Porterfield was one of the old school of "family doctors," much appreciated by his patients and colleagues—a type now said to be almost extinct except in remote areas.

With his partners he conducted a busy practice until his retirement, when he went to live at Portstewart, Co. Derry. Our deep sympathy is extended to his widow, his two sons, and four daughters.—A. P.

C. B. WAINWRIGHT, B.A., M.B.
B.CHIR.

Dr. C. B. Wainwright, formerly in practice in Bermuda, died there on 16 June. He was 82.

Charles Barron Wainwright was born in Bermuda on 12 June 1885, and was educated at the University of Cambridge, graduating B.A. in 1908. For his clinical studies he went to St. Thomas's Hospital, London, qualifying with the Conjoint diploma in 1911, and graduating M.B., B.Chir. the following year. After early house appointments at Guy's Hospital, London, he went out to British Columbia and on the outbreak of the first world war immediately joined the Forces, serving for a time in a submarine, and he also arranged the fitting out of a hospital ship in British Columbia. Shortly after this he came to England, joining the R.A.M.C. and serving for the remainder of the war. After demobilization in 1919 with the rank of captain, he returned to Bermuda and settled in general practice. In addition to carrying on a large practice, he was for many years chairman of the local medical board, and held the appointment of surgeon to the King Edward VII Hospital in Bermuda, where he also supervised the *x*-ray department. He was instrumental in organizing the Bermuda war veterans' association in 1919. For many years he was senior medical officer to the Bermuda Volunteer

Rifle Corps, in which he held the rank of major. He was honorary secretary of the Bermuda Branch of the British Medical Association from 1921 to 1953, and president of the Branch from 1953 to 1963.

Despite his many activities, Dr. Wainwright found time for relaxation and recreation. He was an excellent fisherman and a keen golfer, but his favourite pastime was sailing, and he had held all three ranks as flag officer of the Royal Bermuda Yacht Club. He leaves a widow and a daughter.

P. G. TRAFFORD, M.R.C.S., L.R.C.P. L.D.S.

Dr. P. G. Trafford, who practised in Scunthorpe, Lincolnshire, for nearly forty years, died suddenly on 2 August. He was 68.

Philip George Trafford was born at Ruskington, Lincolnshire, on 20 July 1899, and qualified as a dental surgeon in 1922. Shortly afterwards he entered Guy's Hospital, London, taking the Conjoint diploma in 1925. He held the appointment of honorary dental surgeon to the War Memorial Hospital at Scunthorpe for over thirty years, and during the second world war also carried out the duties of anaesthetist with the Emergency Medical Service. Although practising as a dental surgeon, Philip Trafford retained his medical knowledge, and kept well up to date to a considerable degree. His skill as a diagnostician was revealed on many occasions.

Philip was a man of absolute integrity and transparent honesty, and these qualities made him one of the most respected members of the profession. He was very happily married, and, although not blessed with children, he had quite a number of godchildren. They not only loved him but also went to him not infrequently with their troubles, and they were always received in a very friendly and sympathetic manner. "P.G.," as he was not infrequently known to his friends, enjoyed a game of golf, and was an expert fly fisherman.

We extend to his wife, who was always a wonderful partner, our heartfelt sympathy.—W. H. B.

A. SIMONS, L.R.C.P.&S.ED. L.R.F.P.S.GLASG., D.OBST.R.C.O.G.

Dr. A. Simons, a general practitioner in Glasgow, died suddenly at his home on 1 September. He was 50.

Aaron Simons was born in Glasgow on 16 October 1916, and received his early education at Queen's Park Secondary School. He left school to work in the family business, but in a few years realized that this did not provide the challenge he wanted. He studied privately, passed the university preliminary examinations, and entered Anderson's College of Medicine in Glasgow at the age of 21, taking the triple qualification in 1943. During his student life he took part in many activities, and was president of the Glasgow Jewish Students Society. He was house-surgeon at the Royal Maternity Hospital, Glasgow, and during the second world war was house-physician at Lennox Castle Hospital, under the Emergency Medical Service, before serving in the R.A.M.C. in the United Kingdom, Italy, and India. After demobilization with the rank of captain, he took the D.Obst.R.C.O.G. in 1948, and entered general practice.

Aaron Simons had a profound understanding of human nature and a respect for learning, and these qualities, together with his warm-heartedness, made him an excellent general practitioner who was loved by his patients. He lost no opportunity in attending postgraduate lectures and courses, and was a member of the College of General Practitioners and the Psychosomatic Society. By nature he was gay and relaxed and delighted in the theatre, music, and literature. He was a proficient violinist, and even took his violin with him abroad when he was in the Army. He married his wife, Rose, in 1952, and they were ideally happy with their three children, and we all gained strength and comfort from association with a man of noble character. For several years before his sudden death his youthful bounding energy was diminished, but he maintained a courageous face to the world and never complained.—A. G.

J. M. KNIGHT, M.R.C.S., L.R.C.P.

Dr. J. M. Knight, a former assistant geriatrician to the Wigan and Leigh Hospital Group, died suddenly on 21 August. He was 58.

James Manson Knight was born on 21 June 1909, and received his medical education at Leeds University, qualifying with the Conjoint diploma in 1940. He then joined the R.A.M.C., and spent four years as a prisoner of war. On his return he served as a medical officer at the sanatorium, Bridge of Weir, and at Scotton Banks Hospital, Knaresborough. He later moved to Lancashire, and became assistant geriatrician at Billinge Hospital, near Wigan.

J. K. H. writes: Until shortly before his death Dr. Knight had been a devoted worker in the geriatric department of Billinge Hospital. He was a man with an active brain and many gifts, but one whose life had had more than its share of tragedy. At an early age he lost his father—a medical officer of health for Scarborough. After his four years as a prisoner of war his first wife died in childbirth. Later he developed tuberculosis, for which he required extensive operative surgery. On recovery he worked in tuberculosis sanatoria for several years. He married a nursing sister, who died just over a year ago after a prolonged illness. So has passed a sympathetic doctor, a forthright and honest man, and a firm friend.

J. A. HADFIELD, M.A., M.B., CH.B.

G. N. and G. A. write: Many years ago, when we first became interested in the uses of hypnosis in medicine, we naturally came across the name of J. A. Hadfield (obituary, 16 September, p. 742). Even then his name was almost a legendary one because of his work in restoring to health many of the victims of "shell-shock" during the first world war. His recent death at an advanced age has thus severed the last remaining link between those earliest psychiatrists working on hypnosis and the present generation. It is to him that we owe the development of the technique of hypnoanalysis in psychotherapy, and it was from studying his pioneer work with this method of abreaction and psychocatharsis that most of us have obtained our results. Many have followed the lead which he gave as a result of his own wartime experiences of 50 years ago. He had a far-reaching and inquiring mind which ranged over the whole of medicine, and if he had not chosen psychopathology as his specialty he would have undoubtedly become a great general physician. His own *Psychology and Morals*, which has been reprinted in many editions since 1920, bears witness to his literary skill as well as to his penetrating insight into human nature.

As to Hadfield's personal charm, and his attitude of benign love and affection, others have written elsewhere. His death has meant a great loss to our profession and to psychiatry in particular.

L. MORRIS, M.D., F.R.C.S.

S. R. writes: Having had the privilege of close association with the late Mr. Leslie Morris (obituary, 9 September, p. 685) for more than 20 years, I would like to pay tribute to this very remarkable, able, and kindly man. Two aspects of his personality made a very profound impression. One was his amazing degree of intelligence—often hidden under a cloak of genuine modesty—and the high intellectual level at which he studied and enjoyed those cultural pursuits which afforded him so much deep pleasure. The other was his innate kindness, generosity, and compassion, qualities which he was shy of emphasizing, but which he exercised in his quiet retiring way whenever the opportunity occurred. Many patients unknowingly benefited from his practical help, when Morris ruthlessly cut through red tape in order to speed succour to the handicapped.

The pursuit of his hobbies afforded him a wealth of happiness. He became extremely knowledgeable about ballet and opera—especially Wagner—and whenever possible he would travel to Covent Garden, to become immersed in the music of *The Ring*, or to pick out infallibly the talented and rising ballerinas. He was a discriminating collector of old English silver, being satisfied only with the genuine and artistically designed pieces. Persian carpets and water colours by the masters of this kind of painting attracted him strongly, while on old English porcelain he had an unrivalled expertise.

In the social field Morris was a delightful host, ever thoughtful for the comfort and contentment of his guests, never at a loss for light or enlightened conversation. During his latter years the domestic scene was enlivened by the happy marriages of his daughters, and by the arrival of grandchildren. His wife, always steadfast and ready to join in with anything that gave him pleasure, was a source of great comfort, especially in the period of his illness shortly before retirement. With her, and all his family, his many friends will feel the utmost sympathy at his passing.

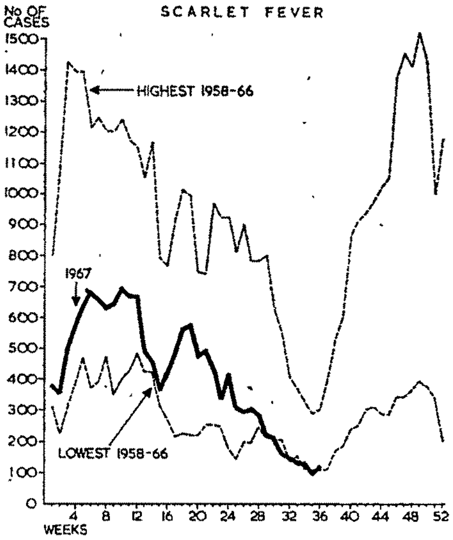
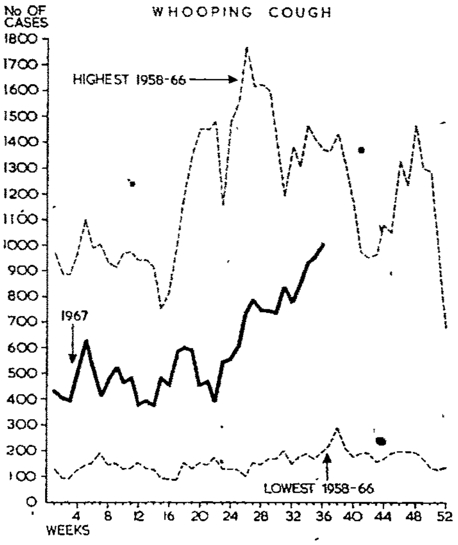
Graphs of Infectious Diseases

The graphs below show the uncorrected numbers of cases of scarlet fever and whooping-cough in England and Wales. Figures for 1967 are compared with the highest and lowest figures for each week in the previous years shown.





INFECTIOUS DISEASES AND VITAL STATISTICS

Summary for British Isles for week ending **9 September** (No. 36) and corresponding week 1966.

Figures of *cases* are for the countries shown and for Greater London. Figures of *deaths* and *births* are for the whole of England and Wales (London included), Greater London, the 17 principal towns in Scotland, the 10 principal towns in Northern Ireland, and the 14 principal towns in Eire.

A blank space denotes disease not notifiable or no return available.

The table is based on information supplied by the Registrars General of England and Wales, Scotland, N. Ireland, and Eire, the Ministry of Health and Local Government of N. Ireland, and the Department of Health of Eire.

MEDICAL NEWS

Clinical Pharmacology

The need to increase facilities for clinical pharmacology in Britain is urged by Dr. D. A. LONG, Chief Medical Adviser and Deputy Research Director of the Wellcome Foundation Limited. In a report to the Association of the British Pharmaceutical Industry he suggests that a committee representing industrial and academic medicine should be set up to advise on this. Other suggestions include setting up a chair of clinical pharmacology in every teaching school in Britain; establishing training fellowships in clinical pharmacology; and the creation of an institute of therapeutics to arrange clinical pharmacological studies and to investigate special problems, such as the toxicity of phenacetin. The report is obtainable free of charge from the Information Services Department of the A.B.P.I.

Head of John Curtin School of Medical Research

Professor FRANK FENNER has been appointed Head of the John Curtin School of Medical Research in the Institute of Advanced Studies of the Australian National University at Canberra. Professor Fenner graduated in medicine at the University of Adelaide in 1938. From 1940 to 1946 he served in the Second Australian Imperial Force in the Middle East and South-west Pacific Areas, and in 1946 joined Sir Macfarlane Burnet, F.R.S., at the Walter and Eliza Hall Institute in Melbourne. After a year (1948–9) at the Rockefeller Institute in New York he was appointed to the foundation Chair of Microbiology in the John Curtin School of Medical Research, where he developed a group working on animal virology. He was elected Fellow of the Australian Academy of Science in 1954, F.R.S. in 1958, and F.R.C.P. in 1967. His predecessor, Sir Hugh Ennor, was appointed to the position of Secretary to the Department of Science and Education of the Commonwealth of Australia in February this year.

[Australian News and Information

Professor of Ophthalmology at Enugu

Professor H. C. KODILINYE, professor of ophthalmology at the University of Ibadan, has been appointed Dean of the Medical School of the University of Biafra, Enugu, and also to the Chair of Ophthalmology in the University.

Professor Kodilinye, who graduated at the University of Glasgow in 1935, trained in ophthalmology at Newcastle upon Tyne, Oxford, and London, and was for over 12 years consultant ophthalmic surgeon to the Manchester Regional Hospital Board prior to accepting in 1961 the appointment of senior lecturer in ophthalmology at the University of Ibadan. There he built up a department of ophthalmology and was in 1963 appointed to the first Chair of Ophthalmology in tropical Africa.

Professor Kodilinye is a member of the Faculty of Ophthalmologists, the Ophthalmological Society of the United Kingdom, and the West African Association of Surgeons. He has published many papers on his own subject.

Indomethacin: Unidentified Drug

The Minister of Health has received the following letter from the Committee on Safety of Drugs:

> "It has come to the attention of the Committee that two varieties of capsules of an unidentified drug described as 'indomethacin' have been distributed at a number of pharmacies in the London area. Indomethacin is a patented drug, and capsules supplied by its manufacturers in this country are coloured yellow and bear the inscription 'MSD 25' in pale bluish-grey. The unidentified capsules are either yellow with a reddish tinge but unmarked, or yellow with the inscription in black 'MRC 25.'
>
> "Indomethacin is a valuable and potent drug, but one whose known side-effects call for care in its use by the physician. It is a matter of especial concern, therefore, to the Committee that it has received no submission from manufacturers or importers of the unidentified drug.
>
> "The Committee accordingly recommends to the Ministers that doctors and pharmacists should be advised that, since the unidentified preparations described have not been submitted for its scrutiny, the Committee is unable to pass any opinion on their safety in use."

The Ministry states that further inquiries are being made about this drug, but in the meantime pharmacists, dispensing doctors, and hospitals are advised not to use the unidentified capsules described in dispensing prescriptions.

Plight of the Disabled

In Britain too little effort has been made to assess the effects of disability on function. This claim is made by Professor PETER TOWNSEND, of the Department of Sociology at the University of Essex, in a lecture to the Royal College of Surgeons in May 1967 which has recently been reprinted as a pamphlet. If a functional assessment was used he considers that between 3% and 6% of people under pensionable age would be classed as physically or mentally handicapped. A survey by his Department showed that there were four major problems: poor housing; inadequate community care services; finding paid employment: and inadequate total income. Professor Townsend lists the priorities for improving this situation as more good housing, better community services, and more generous motorized transport. Other proposals are that various forms of subsidy and encouragement to employers might be tried, and that a generous pension based on the degree of limitation of capacity should be introduced for both men and women. The pamphlet, entitled *The Disabled in Society*, is obtainable from the Greater London Association for the Disabled, 183 Queensway, London W.2, price 3s.

National Nursing Staff Committee

A National Nursing Staff Committee has been set up by the Minister of Health, with Mrs. I. GRAHAM BRYCE as Chairman, following the recommendations of the Salmon Committee on Senior Nursing Staff Structure (see *B.M.J.*, 1966, **1** 1375). Its members include Dr. D. MACMILLAN, of the University of Leeds, and Dr. A. B. TAYLOR, of the United Birmingham Hospitals.

Interview Board for North America

The Interview Board sponsored by the Ministry of Health (see *B.M.J.*, 15 July, p. 128) will leave London on 30 September to meet British doctors in North America. The Board consists of Dr. R. H. BARRETT, Dr. A. TALBOT ROGERS, and Mr. A. J. COLLINS—all from the Ministry; and Dr. CHRISTIE W. GORDON, Dr. STEPHEN R. S. WHITTAKER, and Professor A. G. W. WHITFIELD. The Ministry state that the response to the creation of this Board has been so good that its tour has been extended. Interviews have been arranged in Washington, Chicago, San Francisco, Vancouver, Calgary, Winnipeg, Toronto, and New York. The purpose of the interviews is to give British doctors the latest information on opportunities in the hospital and general-practitioner services and to ascertain their views about medical emigration. Hospital boards and executive councils have told the Interview Board about current vacancies in posts which might interest doctors wishing to return to Britain.

Research in Otology

Applications are invited by the Royal Society of Medicine for the Norman Gamble Research Prize of £50, and for grants from the Norman Gamble Research Fund. Further details may be obtained from the Assistant Secretary, Royal Society of Medicine, 1 Wimpole Street, London W.1.

Order of St. John of Jerusalem

We regret that the list of appointments and promotions to the Most Venerable Order of the Hospital of St. John of Jerusalem (23 September, p. 807) omitted the name of Colonel ROBERT G. W. OLLERENSHAW, E.R.D., T.D., who has been promoted from Commander (Brother) to Knight. Colonel Ollerenshaw has also recently been appointed a Deputy Lieutenant for the County Palatine of Lancashire.

People in the News

▶ PROFESSOR W. J. H. BUTTERFIELD, professor of medicine at Guy's Hospital Medical School, and a member of the World Health Organization Expert Committee on Diabetes Mellitus, has been elected chairman of the British Diabetic Association executive council.

▶ Dr. R. A. KEMP HARPER has been appointed as civilian consultant in radiology to the Royal Navy.

▶ Dr. K. B. ROBERTS, at present Reader in Physiology at the London Hospital Medical College, has been appointed Associate Dean of Medicine and head of the department of physiology at the Memorial University, St. John's, Newfoundland.

▶ Professor IAIN MACINTYRE of the Royal Postgraduate Medical School, London, is to share with Professor D. H. COPP, of Vancouver, a $5,000 annual award by the Gairdner Foundation of Canada for his demonstration that thyrocalcitonin is produced by the thyroid gland.

Coming Events

Middlesex Hospital Medical School.—Annual refresher course for former students, 29 September to 1 October.

Westminster Hospital and Medical School Old Students.—Annual dinner, 5 October, 7.15 p.m., Quaglino's Restaurant. The chairman will be Dr. S. P. MEADOWS.

Institute of Hospital Administrators.—Conference, "The Future Pattern of Hospital Management," 19 October, 10.30 a.m., Queen Mary Hall, Y.W.C.A. Central Club, Great Russell Street, London W.C.1. Fee £1 (10s. to members of I.H.A.). Applications for tickets, accompanied by remittance, should be sent to Secretary, Institute of Hospital Administrators, 75 Portland Place, London W.1.

Biological Engineering Society.—Demonstrations in biomedical engineering, and scientific meeting, 20–21 October, London W.C.1. Details from Mr. W. J. Perkins, National Institute for Medical Research, Mill Hill, London N.W.7.

Societies and Lectures

For attending lectures marked ⊕ a fee is charged or a ticket is required. Applications should be made first to the institution concerned.

Friday, 29 September

ROYAL COLLEGE OF OBSTETRICIANS AND GYNAECOLOGISTS.—4 p.m., William Meredith Fletcher Shaw memorial lecture by Dr. E. A. Gerrard: The Patient as an Individual.⊕

Monday, 2 October

BLAIR BELL RESEARCH SOCIETY.—At Nuffield Hall, Royal College of Obstetricians and Gynaecologists, 5.30 p.m., papers by Professor A. C. Turnbull, Dr. R W. Beard, and Dr. S. M. M. Karim.

CHELMSFORD MEDICAL EDUCATION AND RESEARCH TRUST.—At Chelmsford Medical Academic Unit, London Road (grounds of Chelmsford and Essex Hospital), 5.30 p.m., clinical meeting.

INSTITUTE OF LARYNGOLOGY AND OTOLOGY.—5.30 p.m , Professor I. Friedmann, Dr. D. A. Osborn, Dr. M. I. Wright: clinicopathological conference.

ROYAL COLLEGE OF PHYSICIANS AND SURGEONS OF GLASGOW.—At Maurice Bloch Lecture Theatre, 5.30 p.m., Blackham lecture by Professor C. C. Booth: Cellular Responses in the Small Intestine.

SOCIETY FOR MEDICAL AND DENTAL HYPNOSIS.—At Royal Society of Medicine, 8 p.m., presidential address by Dr. J. Hartland: Hypnosis in the Development of Modern Psychological Medicine.

Tuesday, 3 October

KENT POSTGRADUATE MEDICAL CENTRE AT CANTERBURY.—At Kent and Canterbury Hospital, 8.30 p.m., Dr. W. W. Brigden: General Principles of Electrocardiography.⊕

NEATH POSTGRADUATE MEDICAL CENTRE.—At Neath General Hospital, 4 p.m., Professor A. J. Dhruva (Bombay): Our Experiences with Prolonged Perfusion.

ROYAL ARMY MEDICAL COLLEGE.—5 p.m., Sir Graham Wilson: Prophylaxis of Tetanus.

ST. CHARLES'S HOSPITAL MEDICAL CENTRE.—8 45 p.m., Mr. L. A. Ives: The Acute Abdomen.

WHIPPS CROSS HOSPITAL.—At Medical Education Centre, 1 p.m., clinical meeting.

Wednesday, 4 October

BROOK GENERAL HOSPITAL.—At Postgraduate Medical Centre, 8 15 p.m., Mr. D. W. C. Northfield: Differential Diagnoses of Intracranial Tumours in the Adult.

CHELMSFORD MEDICAL EDUCATION AND RESEARCH TRUST.—At Chelmsford Medical Academic Unit, London Road (grounds of Chelmsford and Essex Hospital), 12 noon, surgical meeting.

INSTITUTE OF DISEASES OF THE CHEST.—5 p.m., Dr. F. P. Lee Lander: Bronchial Suppuration.

ROYAL FREE HOSPITAL.—5.15 p.m., Dr. D. Zimmon (New York): Hepatic Coma.

ROYAL POSTGRADUATE MEDICAL SCHOOL.—2 p.m., Professor G. M. Bull: Place of Chemical Pathology in Modern Medicine.

STOKE MANDEVILLE HOSPITAL.—(1) 12.15 p.m., Dr. H. L. Frankel: Assisted Respiration. (2) 6 p.m., Dr. C. S. Pitcher: Megaloblastic Anaemias—I.

WHIPPS CROSS HOSPITAL.—At Medical Education Centre, course for general practitioners, 2 p.m., Dr. J. T. Wright: The Wind ; 3 p.m., Dr. R. S. Francis: The Respiratory Cripple.

Thursday, 5 October

LONDON UNIVERSITY.—At Anatomy Theatre, University College, 5.30 p.m., special university lecture in human anatomy and morphology by Professor J. E. Rose (Wisconsin): The Tonotopical Organization of the Cochlear Nuclear Complex and On Some Input Signals Reaching It.

ROYAL PHOTOGRAPHIC SOCIETY: MEDICAL GROUP.—At Commonwealth Building, Hammersmith Hospital, 6.30 p.m., visit to new department of medical illustration of Royal Postgraduate Medical School.

ROYAL POSTGRADUATE MEDICAL SCHOOL.—4 p.m., Mr. J. I. Burn: Cancer Chemotherapy and the Surgeon.

ST. MARY'S HOSPITAL MEDICAL SCHOOL.—At Wright-Fleming Institute Theatre, 5 p.m., Aleck Bourne lecture by Mr. E. A. Williams: Congenital Absence of the Vagina.

WHIPPS CROSS HOSPITAL.—At Medical Education Centre, 5 p.m., clinicopathological conference.

Friday, 6 October

INSTITUTE OF DISEASES OF THE CHEST.—5 p.m., Dr. N. C. Oswald: clinical demonstrations.

INSTITUTE OF LARYNGOLOGY AND OTOLOGY.—4.30 p.m., annual address by Dr. P. J. Lawther: Air Pollution and Disease. (At home to medical visitors from 2.30 p.m.)

NEATH POSTGRADUATE MEDICAL CENTRE.—At Neath General Hospital, 8.15 p.m., Professor A. C. Turnbull: Advances in Obstetrics.

ROYAL POSTGRADUATE MEDICAL SCHOOL.—(1) 10.15 a.m., Mr. T. Gibson: Bio-engineering Studies of Skin and other Human Tissues ; (2) 11.30 a.m., Mr. J. S. Calnan: clinicopathological conference (plastic) ; (3) 4 p.m., Professor W. I. Card: Clinical Medicine in the Computer Age.

SCOTTISH PSYCHIATRIC RESEARCH SOCIETY.—At Recreation Hall, Royal Dundee Liff Hospital, 11 a.m., all-day scientific meeting.⊕

WHIPPPS CROSS HOSPITAL.—At Medical Education Centre, 8.30 p.m., clinical meeting.

Saturday, 7 October

ROYAL COLLEGE OF GENERAL PRACTITIONERS: MERSEYSIDE AND NORTH WALES FACULTY.—At Liverpool Medical Institution, 3.15 p.m., Dr. T. S. Eimerl: A Look at General Practice in Australia and New Zealand.

ROYAL COLLEGE OF SURGEONS OF ENGLAND: FACULTY OF RADIOLOGISTS.—At Large Lecture Theatre, Medical School, Foresterhill, Aberdeen, 9.30 a.m., joint meeting of Diagnosis and Therapy Sections devoted to Radioisotope Scanning.⊕

Sunday, 8 October

BRITISH DIABETIC ASSOCIATION: MEDICAL AND SCIENTIFIC SECTION.—At School of Nursing Lecture Theatre, King's College Hospital, London S.E., 11 a.m., symposium for general practitioners: Clinical Diabetes.

ROYAL COLLEGE OF GENERAL PRACTITIONERS: MERSEYSIDE AND NORTH WALES FACULTY.—At New Medical Lecture Theatre, Liverpool, 10.30 a.m., symposium: Recent Advances in General Practice. Speakers, Dr. E. V. Kuenssberg, Dr. J. M. G. Wilson, Dr. P. S. Byrne, Dr. G. W. Roberts. (Details from Dr. A. E. Elliott, 1 Sandown Terrace, Chester.)

Universities and Colleges

LONDON

The title of reader in neurophysiology has been conferred on Dr. G. B. Arden in respect of his post at the Institute of Ophthalmology.

BIRMINGHAM

Appointments.—Dr. D. S. Rowe (reader in experimental pathology) ; Dr. P. Eckstein (reader in endocrinology).

ROYAL AUSTRALASIAN COLLEGE OF PHYSICIANS

The following candidates, who were successful at an examination held in Australia and Singapore, were admitted to Membership of the College on 14 September 1967: R. A. V. Benn, J. P. Chalmers, D. Curran, J. D. Gillies, W. Harvey-Smith, K. J. Hourigan, S. N. Hunyor, A. T. Lammi, R. A. Ouvrier, J. G. Polgar, L. P. Roy, S. K. Sinha, O. T. Stanley, D. J. Tiller, A. G. Walker, M. H. Williams, R. C. Wright, W. E. Woods, and J. S. Yu, of New South Wales ; T. C. Y. Choy, A. Ebringer, A. S. Gallus, J. Igra, G. C. McKay, D. C. Mauger, J. H. McDonald, C. R. F. Richardson, and A. P. Yung, of Victoria ; M. H. Alp, C. W. Bryan, W. Mirosch, and T. J. Myers, of Queensland ; A. B. Black, A. J. S. Corbet, and H. M. Dean, of South Australia ; J. W. Freeman, of Tasmania ; G. N. Cumpston, of Western Australia ; P. M. P. Choy, of Hong Kong ; K. C. Koh, of Singapore.

The following physicians were admitted to Membership of the College without examination under the special provisions of Article 37 on 5 May 1967: J. G. MacKenzie, of Victoria ; D. S. Nelson, of New South Wales.

The following physicians were admitted to Membership of the College without examination under the special provisions of Article 37A on 14 September 1967: D. G. Abrahams and G. C. Smith of New South Wales ; J. A. Forbes, of Victoria ; G. M. Maxwell and T. G. Paxon, of South Australia ; G. Howells, of A.C.T.

New Issues of Specialist Journals

Obtainable from the Publishing Manager, B.M.A. House, Tavistock Square, London W.C.1.

BRITISH JOURNAL OF OPHTHALMOLOGY

Contents of the October issue are as follows :

Xerophthalmia and Protein Malnutrition in Bantu Children. B. S. Kuming and W. M. Politzer.
The Chevalier Taylor and His Strabismus Operation. Fredrik Berg.
Mucocele of the Sphenoid Sinus : A Benign Imitator. A. L. Waldman, R. Merrell, R. B. Daroff, and A. Geltzer.
Primary Tuberculosis of the Conjunctiva. Desmond Archer and Alan Bird.
Primary Conjunctival Tuberculosis. A. W. Sollom.
Retinal Arteriolar Collaterals in Man. C. J. Ball and P. Henkind.
Influence of Menstruation on Glaucoma. Katherina Dalton.
Ocular Manifestations of Polyarteritis Nodosa. M. R. Nanjiani.
Chronic Retrobulbar and Chiasmal Neuritis. Bryan Ashworth.
Optic Nerve Glioma. John R. Condon and F. Clifford Rose.
Multiple Malignant Melanomata of the Uveal Tract in One Eye. R. A. Condon and Joan Mullaney.
Pyrrolidinomethyltetracycline in Cavernous Sinus Thrombosis. B. B. Khare.
Ophthalmological Synopses.
Simple Corneal Lamellotome for Keratoplasty. J. G. Louw, P. L. M. Le Roux, and E. F. Rhategan.
Reviews. Notes.

Annual Conference of Representatives of Local Medical Committees

Second Day's Proceedings

The Annual Conference of Representatives of Local Medical Committees met in the Great Hall of B.M.A. House, London, on 14 and 15 June. Dr. R. B. L. Ridge was in the chair. A report of the first day's proceedings was printed last week (Supplement, *24 June, p. 177). A report of the proceedings on the second day appears below.*

Payments for Special Experience and Service (Resumed Debate)

The Conference resumed at 10 a.m. on 15 June, with Dr. R. B. L. RIDGE in the chair.

Dr. W. B. WHOWELL (Leicestershire and Rutland) moved:

"That this Conference rejects the concept of merit awards as proposed by the B.M.A. working party but it is in favour of the principle of advancement of general practice, and believes that this can best be served by the setting up of a fund to which any general practitioner could apply for the reimbursement of expenses incurred in approved research projects and in approved courses of study of unusual duration."

Dr. Whowell said it was a general motion that should appeal to the Chairman of the General Medical Services Committee, since it did not tie his hands. He realized that the Review Body had stated that the money could be used for no other purpose than for merit awards, but there was a large sum of money available. If the Ministry showed its good faith in its desire to advance general practice and if the Review Body endorsed it the money could be made available for the advancement of general practice. The motion asked for nothing specific and it left the negotiators to obtain what terms they could.

Dr. J. C. CAMERON, Chairman of the G.M.S. Committee, said that, in view of the Conference's decision on the previous day, he was willing to try to carry out the terms of the motion, but it was not going to be easy. It was not a matter for negotiation but of trying to enlist the sympathy of the Minister of Health. Provided that he was allowed a broad interpretation, he was willing to accept the motion.

The motion was carried.

Dr. A. LASK (Middlesex) moved: "That this Conference affirms that it has the future well-being of general medical practice at heart, denies Luddite tendencies, and calls upon the Government to show its sincerity as follows: to use the money allotted for advancement allowances prospectively not retrospectively as awards not rewards; as grants and not part of the pay structure—e.g., experimental and research projects—for sabbaticals, for study leave, and other appropriate schemes."

Dr. Lask said that those in the "highest circles" had strange ideas about general practitioners. They said general practitioners were obstinate, that they were reactionaries on the medical scene, that they had no vision, that they were "Luddites thwarting the progress of medicine." Because general practitioners saw people in their houses, flats, and cottages general practice was called a cottage industry. General practitioners were called mercenary. He hoped the Minister would listen to the wisdom and the experience of general practitioners, and use the money for specific grants and allowances. The Minister should be forward-looking.

Dr. G. R. OUTWIN (Doncaster) said that the profession had unequivocally rejected merit awards. Neither the Ministry nor the Establishment could be in any doubt about the views of the profession. It should retain its dignity. It would be graceless for it to go back and say, "We don't want the money in this way, but we would like to have it in another way."

The motion was lost.

Other Schemes

Dr. A. SPEAKMAN (Liverpool) moved: "That the G.M.S. Committee is requested to prepare schemes for the financing of projects, scholarships, exhibitions, etc., for which general practitioners could apply; also a scheme for the reimbursement of time spent in committee work in the service of general practice as a whole."

The motion was lost.

Dr. A. POLLACCHI (Dunbartonshire) moved: "That, since the Government appears to have £2¼ million to spend on the special payments but is unwilling to allow it to be spent in any other way connected with doctors' remuneration, this Conference suggests that this money be devoted to cancer research."

Dr. SPEAKMAN (Liverpool) moved as an amendment: "That the sentence be altered to read 'This Conference suggests that this money be devoted to cancer and other research in general practice.'"

The amendment was carried.

The motion as amended was lost.

Dr. F. R. B. H. KENNEDY (Isle of Wight) moved: "That this Conference suggests that the £2¼ million be used for the establishment of chairs of general practice."

He said that neither the Minister nor the Review Body were likely to allow this money to go into the pockets of general practitioners, but the motion was a reasonable suggestion for improving general practice. A speaker the previous day had asked for departments of general practice—a department needed a professor and vice versa.

Dr. A. C. ALLEN (Inner London) moved as an amendment: "That the words after 'establishment' be deleted and the following substituted: 'of departments of general practice in teaching and district hospitals staffed by general practitioners.'"

He said that the G.M.S. Committee should be given more direction. The amendment would show general practitioners in this country that the Conference was interested in them.

Dr. G. S. R. LITTLE (Inner London) said the idea of the amendment was to extend the motion. The professorial, academic mind might not always be in touch with the day-to-day affairs of general practice. The motion amended in this way would give a better return.

The amendment was lost.

A motion to pass to the next business was carried.

Direct Charges to Patients

Dr. P. SPENCE (Cheshire) moved: "That the General Medical Services Committee should continue to make representations to the Minister that a doctor be permitted to make a charge to N.H.S. patients for arranging private hospital treatment or private consultation."

He said that when a general practitioner met a consultant at a domiciliary consultation much time was consumed. A consultant often suggested a time for the consultation after surgery hours, perhaps at a weekend. So much depended on the general practitioner's knowledge of the medical history of the case that his place at the consultation could not be taken by a partner or deputy. Surely doctors should be allowed to charge a modest fee for this extra work which the patient in most cases would be only too willing to pay.

Dr. D. NUTTALL (Leeds) supported the motion. He said that if it was accepted it would not bring any hardship on any patient. Dr. F. J. DAVIES (Dudley) said it was a mean motion based on the principle, "If I can't have it, why should the consultant?"

Dr. B. J. KENDRICK (Nottingham County and City) was against the motion on principle. It was wrong that a patient could decide to be a private patient on some occasions and a National Health Service on others.

Dr. CAMERON said that it was not quite so simple as the last speaker had made out. There were many people who insured for hospital and consultant treatment and yet remained on a doctor's N.H.S. list. General practitioners were not unwilling to help their patients to have their treatment in whatever form they wished it, but there was much to be said for the doctor being recompensed for the time spent in making the arrangements for his N.H.S. patients to have specialist treatment privately. During the negotiations the Minister had been sympathetic on this matter, but in the end he had come down against the idea, because, as he had often put it, while he did not want to do anything to discourage private practice, he was not prepared to do anything which might encourage it. Dr. Cameron did not think any further progress would be made on this subject in the present political climate, but at an opportune moment further efforts might be made to open discussions again.

The motion was carried.

Prescribing Oral Contraceptives

A motion by Warwickshire and Solihull and one by Inner London were, by leave, withdrawn, and substituted by the following composite motion:

"That the recommended fee of 10s. 6d. for a private prescription for oral contraceptives is entirely inadequate and unrealistic, and there should be a revision of paragraph 10(1)(G) of the terms of service so that a proper fee can be agreed for the examination of and the advice given to a patient when the work is done solely as a result of her request for contraception and is not indicated by any of the signs or symptoms of medical or physical disease."

Dr. T. A. W. PARKES (Warwickshire and Solihull) said that the motion called for a review of the paragraph of the terms of service which stated that no fee should be demanded or accepted for examining or advising patients in connexion with contraception, though a fee could be claimed for writing a prescription for contraceptive pills or appliances. Dr. Parkes said that in his area there was a great demand for oral contraceptives, and that meant far more than writing a prescription. It was necessary to take a careful history and make a detailed examination followed by advice and instruction and a follow-up at intervals. Most of the requests were on purely social grounds and could not be regarded as treatment. It was a time-consuming procedure for which the doctor should be paid a proper fee.

Dr. M. L. HUDSON EVANS (Inner London) supported the motion, and hoped that its scope would be widened. Dr. H. S. SAMUEL (Berkshire) opposed the motion. The provision of contraceptives should be, and always was, accompanied by the necessary examination, and it was important to the patient's mental and physical health as well as to that of her husband. It was impossible to draw the line between what was mental and physical health and what was not. This was essentially part of medical services, and it was derogatory to the profession to demand an extra fee.

Social and Medical Indications

Dr. JOAN CHAPPELL (G.M.S. Committee) said that the subject was much more complicated than it appeared at first sight. Family doctors could not escape their responsibility for giving contraceptive advice. To distinguish between the medical and social indications for contraception was unrealistic. A doctor's first concern was with his duty to his patients. Legal opinion had been taken and she believed that an amendment to this section of the terms of service was already in hand.

Dr. CAMERON said that progress was being made, but negotiations had broken down because of the difficulty in separating medical from social grounds. He hoped that the Conference would allow the matter to rest for the moment.

Dr. SHERLOCK (East Suffolk) reminded the meeting that before the National Health Service doctors charged their patients what they thought was reasonable in the circumstances, in some cases nothing. Today a fee of half a guinea was worth little. The advice would be cheap at double or treble the amount.

The motion was lost.

Bolton, by leave, withdrew a motion "That this Conference registers its protest at the delay in settlement of the Pool payments for the years 1964–5 and 1965–6, and urges the Minister of Health to expedite an early settlement of these payments."

Payment by Salary

Dr. ALLEN (Inner London) moved:

"That this Conference instructs the General Medical Services Committee to cease all negotiations on a salaried service for those who desire it until the Minister of Health agrees that provision for payment by item of service, envisaged in the Charter, should also be made available for those who wish to be remunerated in this way."

He said that, despite his promise, the Minister had refused to consider payment by item of service. General practitioners must face the Minister's intransigence with determination. So long as he refused to discuss what doctors wanted they should refuse to discuss what he wanted.

Dr. D. DEENY (Armagh) said he did not believe that the item-of-service method of payment was contrary to socialist ideas. If there was such a method of payment it would show that doctors were now being poorly paid. The existing method of payment was only indirectly related to the amount of work done. Item-of-service payment was part of the Charter. It was the method by which their dentists were paid, and it was the method in use in many countries.

Dr. R. W. SMITH (North-east London) said that he did not find the existing method of payment particularly distasteful, and any scheme for payment by salary would need to have very definite advantages before he would be prepared to consider it. Nothing acceptable had so far emerged in the discussions with the Ministry, but that was no reason for not exploring the matter further. That was what any trade union would do—explore all the possibilities. Doctors could learn from the flexibility of approach of their Continental colleagues.

Dr. G. MURRAY JONES (G.M.S. Committee) said that a salaried service meant being paid on a sessional basis, as were consultants. No form of payment should be thrust on the medical profession. There must be trial schemes.

Dr. J. S. NOBLE (G.M.S. Committee) asked the Conference to read the motion carefully. It said nothing about exploring the possibilities: it said "cease all negotiations." He hoped the motion would be passed. The doctor had an individual responsibility to his patient and the patient had a loyalty to his doctor. The personal relationship was being eroded, and there must be a return to the individual element rather than the salary element in the payment of doctors. This could be done by negotiating an item-of-service basis of payment.

Dr. C. J. SWANSON (G.M.S. Committee) spoke against the motion. He had in mind doctors who worked in remote places. Many of them would prefer a salary, and he did not want to have to go back to them and say, "You cannot possibly have a salary until Inner London doctors are paid by item of service."

Dr. KENDRICK (Nottingham County and City) said that what the profession had in mind was payment on a sessional basis, but when the Minister talked about salaried service he meant a service like the Army or the police. The profession should be prepared to talk to the Minister about sessional payments, but it was stupid to negotiate a salaried service when nobody wanted it.

Breach of Faith

Dr. I. M. JONES (G.M.S. Committee) supported the motion. The Charter for the Family Doctor Service had had a wider measure of support than any other recent proposals for general practice. The Charter had stated that a doctor should have the option of payment by capitation, by item of service, or by salary. The Minister of Health had accepted the Charter as a basis for negotiation. Since then he had been prepared to discuss ways of implementing the salaried option but unprepared to discuss the implementation of the item-of-service option. That was a breach of faith. The Conference should meet the Minister's obduracy with obduracy, and state that it would discuss the Charter in full as originally agreed.

Dr. E. V. KUENSSBERG (G.M.S. Committee) said that the motion was telling Dr. Cameron how to conduct the negotiations. It was wrong to tell somebody so experienced in negotiations how and when to play his trump card.

Dr. CAMERON said that to pass the motion would be doing an injustice to those doctors, however few, who wanted a salaried method of payment. The G.M.S. Committee had been asked to devise some method of salaried payment for a limited number of doctors in selected areas, perhaps in group practices. Mention had been made of sessional payments. The Ministry's proposals had been merely a salaried method of payment. The G.M.S. Committee intended to discuss the matter again with the Ministry. If this motion was passed it would be the end of the discussions. That would not worry him personally, but it would be an injustice to those doctors who had supported the Charter and who wished for an experiment in payment by salary.

Dr. ALLEN, replying to the debate, said, "We are weakening, in the same way as we did last year on merit awards. This is . . . where the chink in the armour will occur if we fail to show the Minister that we mean what we say. He will know that the same weaknesses as occurred over merit awards will occur again and again, and he can do what he likes. I beg you to pass this motion."

The motion was carried.

Government's Failure

Dr. M. D. MANSON (Denbigh and Flint) moved: "That the G.M.S. Committee shall not agree to any form of salaried employment for general medical services until the detailed terms and conditions have been approved by the Conference."

He said that a choice of salaried service was part of the Charter. Therefore general practitioners must state their terms and lay down the principles which should govern negotiation. Sessional contracts should form the general basis of the service, and be similar to that for consultants. Full-time service should consist of eleven sessions, and maximum part-time service should consist of nine sessions. A part-time arrangement would enable a general practitioner to combine his work with sessions in hospital, industrial medicine, public health, insurance work, or private practice.

Work load must be clearly defined, said Dr. Manson. Under a salaried contract with rising demand and a decrease in the number of doctors, the profession could no longer accept corporate responsibility for covering any particular number of the population. Doctors would be responsible only for the amount of work for which they had contracted. It would be for the Government to provide additional doctors to meet additional demand. There must be radical changes in disciplinary arrangements. Doctors should be answerable only for their actions during the sessions for which they had contracted. It was vital that no final decision should be reached until a full report had been considered by the Conference.

Dr. SPEAKMAN (Liverpool) moved as an amendment: "That at the end be added the words: 'and the majority of general practitioners in the N.H.S., if necessary by plebiscite.'"

The amendment was carried.

Dr. G. P. WILLIAMS (G.M.S. Committee) believed that there should be flexibility, and both patients and doctors should be able to exercise a wide choice in the arrangements for medical care. It was right that those doctors who did not want a salaried service themselves should support those who did. They must insist on sessional terms and on limiting the work load to a level consistent with good medicine. The actual work load was what should be considered, and not the list size. The terms of service must be tailored to match.

Doctors must state their own terms, and state them in public. If there was any rejection to be done, let the Government do it. The Government should be seen to refuse for general practitioners terms and conditions of service which the consultants already enjoyed. Doctors who advocated a salaried service had their heads in the clouds, because the Ministry could not agree to the sort of salaried service which the profession would accept, nor could the profession accept what the Ministry was likely to propose without creating a dangerous precedent for general practice as a whole. He hoped the motion as amended would be passed.

Dr. CAMERON agreed that the use of a plebiscite was the best way to ascertain the opinion of the profession.

The motion was carried.

A similar motion by Kent was ruled to be covered by the last motion.

Other Motions on Remuneration

The following motions were withdrawn:

Motion by LEICESTER: "That this Conference, while not being in favour of payments for special experience and service to general practice, considers that payments for general experience are inadequate and should be revised."

Motion by WARWICKSHIRE AND SOLIHULL: "That, though we recognize that the present system relieves some anomalies, our negotiators should still press for adequate payment for optimum list size."

Dr. J. RUFFELL (Kent) moved: "That, in the opinion of this Conference, the overall level of remuneration contained in the 1966 Review Body award is too low and is unlikely to increase recruitment or to stem emigration."

He said that the Review Body award bore unfairly on different sections of the profession, and it had been bedevilled by Government intervention as a result of the national economic policy. A proper comparison ought to be made with other countries which were successfully competing for doctors. In Canada, U.S.A., Australia, and New Zealand general practitioners received an average of about £10,000 gross per annum. In this country they received far less and for unlimited work. Since the award there had been no significant drop in emigration and no significant upward trend in recruitment. The conclusion was that the Review Body award had been too little and too late.

The motion was carried.

Dr. J. C. KNOX (Tynemouth) moved: "That the Review Body's urgent attention be drawn to the fact that up to April 1967 Government implementation of their recommended award in respect of general practitioners falls short by approximately £18m. and that the Review Body be asked to recognize this fact in their next review."

The motion was carried.

Refund System

Dr. WHOWELL (Leicestershire and Rutland) moved: "That the effect of the recent doctors' charter is likely to lead to a salaried service unless active steps are taken to prevent this, and that this Conference urges further consideration of a refund system of payment for general-practitioner services."

Notice of an amendment by North-east London was given: "To delete all the words up to and including the word 'and.'"

Dr. WHOWELL said he accepted the amendment. The idea of a refund to the patient had been mooted many times before, and the major argument against it had been the difficulty of administration. In view of the proliferation of forms required to obtain payment for the various items of service under the new pay structure this argument was no longer valid. Many countries had a refund system which apparently worked satisfactorily.

Dr. CAMERON said that the refund system should be given consideration. It was one of the methods of remuneration in European countries.

The motion as amended was carried.

Dr. LITTLE (Inner London) moved: "That additional payments should be made towards the employment of a locum for up to six weeks each year on the same scale and basis, and under the same conditions, as those provided in the scheme for additional payments during sickness."

He said that doctors should be encouraged to take holidays. Locum fees were an extra expense, and it was quite impossible to make provision for a holiday out of the basic practice allowance.

Dr. KENDRICK (Nottingham County and City) said that the Minister ought to pay the cost of a doctor's holiday locum and the Minister should be responsible for providing the locum, as in the hospital service. However, Dr. Kendrick said he was against the motion, because to start to negotiate now about itemizing the cost of holidays would weaken the doctors' overall case. The Conference had already asked the G.M.S. Committee to itemize each item in the basic practice allowance, and that included six weeks' holiday and a locum allowance.

The motion was lost.

Professional Negotiator

Dr. D. Clarke (Lanarkshire) moved: "That this Conference recommends the appointment of a suitably qualified and adequately paid professional negotiator to represent the profession in any future negotiations regarding remuneration."

He said that general practitioners were not suited to conduct the necessary detailed negotiations. By training they were too trusting. The present negotiators should continue to negotiate on broad principles, but the details should be left to people trained in the minutiae.

Doncaster and Sheffield moved as an amendment that the motion should read: "That this Conference recommends the appointment of a suitably qualified and adequately paid legal adviser who would accompany the profession's representatives during the course of all negotiations with the Ministry on remuneration and terms of service."

Dr. W. P. Lambie (Sheffield) said he was not in favour of a professional negotiator. The profession should be represented only by active general practitioners. However, he had been particularly impressed by the success of counsel who had presented the profession's case to the Review Body. A lawyer should accompany the negotiators. Dr. G. R. Outwin (Doncaster) supported the amendment. Dr. Cameron would say that legal advice was always available, and was frequently sought. But Dr. Outwin said he wanted the legal adviser to be present on the occasions when it was not expected that his advice would be needed.

Dr. Kendrick (Nottingham County and City) also supported the motion, but Dr. A. A. Brown (City of Edinburgh) told the Conference that it would cost in the region of £10,000 a year.

Dr. A. B. Davies (Staffordshire) said that to pass the motion would be a vote of no confidence in Dr. Cameron and his fellow negotiators. He had experience of negotiating, and he knew that when documents were being prepared expert legal advice was taken. But it would be nonsense to have a legal adviser at all negotiations with the Ministry. Their own negotiators were selected because they had a detailed day-to-day knowledge of every part of general practice.

Dr. R. A. Keable-Elliott (G.M.S. Committee) hoped the motion would be rejected. The negotiators had to negotiate. The only way to do that was to know the background to the whole matter and to know the feeling of the profession, and nobody was in a better position for that than Dr. Cameron and his team.

Facts Not Known

Dr. Kuenssberg (G.M.S. Committee) said it would be foolish to accept the motion. The proposers of the motion just did not know the facts. Whenever big issues were at stake legal advisers were always with the negotiators. Professional advisers were available all the time—that was what the Secretariat was. It had been said that a legal adviser would notice the flaws before the negotiators—what nonsense! The procedure of negotiation was that possible ways for making progress were discussed, and then something was committed to paper. Once it was on paper it was shown to all the experts.

Dr. A. M. Maiden (G.M.S. Committee) said that in the majority of negotiations the people required were those who knew general practice from the practical side. It was a waste of time and money to engage a highly paid legal adviser and it would not help. The G.M.S. Committee had always taken the view that *ad hoc* expert advice should be taken when it was needed.

Dr. Cameron said he had given much thought to the idea of a professional negotiator, but he had become firmly of the opinion that in negotiating on general practice matters it was better to have doctors facing the Ministry than professionals. Much money had been spent on legal advice during the course of negotiations, and looking back he did not think the profession had done too badly.

Dr. Clarke, replying to the debate, said that there was no question of a vote of confidence. General practitioners needed their present team, but they also needed legal advice, especially if they went into a field which was unexplored, such as salaried service. The cost could be dismissed.

The motion, as amended, was lost by an overwhelming majority.

Practice Premises

Dr. Cameron moved: "That paragraphs 82–91 of the report of the G.M.S. Committee be approved."

The motion was carried.

Dr. R. G. G. Gain (Hertfordshire) moved: "That, in view of the recent continuing reduction in bank rate, the interest rate charged by the Finance Corporation is unrealistic and unattractive and should be reduced forthwith."

He said he did not wish to decry the work of the General Practice Finance Corporation. Since it was set up the bank rate had twice fallen. It now stood at 5½%, whereas the Finance Corporation rate remained at 7¼%. His local medical committee thought it should be reduced to a lower and more realistic figure.

Dr. S. Wand, a member of the Finance Corporation, said that it had a statutory duty to secure that its revenue was sufficient, taking one year with another, to make provision for meeting all charges properly chargeable to revenue account, including allocations to reserve. The Corporation had been directed to set up a reserve. It did not necessarily follow that because the bank rate went down money could be borrowed at a lower rate at that particular time. The 7¼% charged by the Corporation did not leave much for the expenses of the Corporation and for providing a reserve. He had tried to get the rate as low as possible, and this rate was the lowest possible at the moment. The advantage of the Corporation was that it was possible to get 100% loan, including the expenses incurred in building or acquiring a property.

Dr. Cameron hoped that the Conference would not vote on the motion. Dr. Wand had said that everything possible would be done to keep the rate as low as possible. The Finance Corporation was independent, and it would be unfortunate if the motion was passed.

A motion to pass to the next business was put, seconded, and carried.

A motion that the speeches of movers of motions should be limited to three minutes and those of other speakers was moved and carried.

Terms of Service

Dr. N. S. Malimson (Salford) moved: "That this Conference recommends that there shall be no allocation of patients to a doctor's list without the doctor's consent."

He said that the profession had been inculcated with the idea that there was such a thing as compulsory allocation. There was no power of compulsory allocation. The profession had been deluded for too long. The Act placed on the Minister an obligation to distribute patients who could not find a doctor or who had been refused by a doctor. The Act did not place upon doctors an obligation to accept those patients.

Dr. Knox (Tynemouth) hoped that the Conference would pass the motion. For years lip service had been paid to the independence of the family doctor and his status; this would convert words into deeds. Dr. J. C. Arthur (Gateshead) said that the problem had grown in under-doctored areas, because the doctors could not take any more patients.

Dr. Kendrick (Nottingham County and City) opposed the motion. He was not worried about the existing allocation scheme, so long as doctors were sensible. Doctors had to preserve their right to be able to take a patient off their list without giving any reason.

Dr. Webb (Ipswich) asked whether the statement that doctors did not have to accept a patient allocated to them was correct.

Dr. Cameron said that further advice would have to be taken on that. The Minister took the view that the allocation scheme was necessary in order that he could fulfil his obligation to see that every citizen who wished was able to use the National Health Service. However, Dr. Cameron said he would resist doctors being compelled to take block allocations.

The motion was carried.

Dr. Ruffell (Kent) moved: "That this Conference considers that the G.M.S. Committee should negotiate list sizes beyond which no doctor should be required to accept the allocation of new patients."

He said his main concern was with block allocations. With the existing situation in which a declining medical force was still responsible for the continuous care of all people all the time he thought the allocation scheme was going to be used more and more. A figure of 2,000 was a list size beyond which no doctor could practise an adequate standard of medical service without undue physical and mental effort.

Dr. Keable-Elliott (G.M.S. Committee) said that the motion was meaningless, because it was asking the G.M.S. Committee to negotiate list sizes. What was important was the work that was done. Other things besides numbers determined the amount of work done, such as whether the doctor dispensed, whether he did his own midwifery, and so on.

Dr. Outwin (Doncaster) agreed that list size could not be negotiated, but it was the only tangible argument on which to approach the Minister. The Council had recently passed a motion to the effect that the profession could no longer accept overall responsibility for the preservation of standards of medical care which a modern community had a right to expect, and that tied in with the present motion.

Dr. CAMERON said that what was alarming him was the possibility of the allocation scheme being used for block allocation. The use of the scheme for that purpose would be resisted.

The motion was carried.

Dr. SPEAKMAN moved: "That any practitioner having a person assigned to him shall have the right of appeal to the local medical committee." The motion was carried.

Interim Treatment

Dr. T. K. COOKE (Yorkshire, North Riding) moved:

> "That this Conference requests the G.M.S. Committee to approach the Minister with a view to the immediate amendment of paragraph 2 of the allocation scheme so that it reads: 'It shall be the duty of a practitioner who refuses to accept a person who applies for acceptance to give the applicant such treatment, if any, as may be necessary.'"

He said that he realized that this point was currently under discussion, but in the meantime some colleagues might suffer from disciplinary procedure unless paragraph 2 of the allocation scheme was amended. The wording of paragraph 2 (*a*)—namely, to give the applicant such treatment, if any, as might be required by him pending his acceptance by or assignment to a practitioner—was, to say the least, ambiguous and wrong in substance. It was not for the patient to define the treatment. By inference, the motion implied that paragraph 2 (*b*) should be completely omitted. That read: "To inform the applicant of the name and address of any neighbouring practitioner, or practitioners, to whom application for acceptance might be made, and to inform him of the name and address of the council for the purpose of enabling him, if necessary, to secure assignment to a practitioner." However necessary that might have been in 1948, Dr. Cooke said, he could not see any reason why this entirely non-medical function should be placed upon doctors. A dentist on declining to accept a patient under the N.H.S. had no obligation to refer him to other dentists.

Dr. KNOX (Tynemouth) moved as an amendment: "Delete the words 'if any, as may be necessary' and substitute 'as the doctor may consider necessary at the time.'"

He said that the amendment set out the legal obligation. The original motion stated what they would do as their ordinary duty as human beings.

The motion as amended was carried.

Dr. SPEAKMAN (Liverpool) moved: "That a practitioner should be entitled to exercise his fundamental professional right to refuse treatment to a patient (other than in an emergency) in respect of whom he has no contractual obligation, and even then for limited duration."

He said that the motion only urged the Conference to restate a principle and give the G.M.S. Committee backing in order to preserve a right of the profession.

Dr. CAMERON accepted the motion, which was carried.

The following motions from Liverpool were also carried: (1) "That a practitioner's liability for the treatment of a patient must be defined in terms of time and place—i.e., the site where the patients elects to have any home treatment," and (2) "That, subject to adequate public safeguards, a practitioner must be capable of redefining his visiting area."

Dr. KNOX (Tynemouth) moved: "That a doctor who contracts out of evening and weekend work should be legally free of his contract with the National Health Service during the hours for which he has contracted out."

Dr. Knox said that under the new contract it seemed that a general practitioner could contract out of out-of-hours responsibilities provided he got someone else to do the work. Dr. Knox said he wanted to know whether the contract really meant that, and what was the exact position of a doctor who contracted out.

Dr. CAMERON said that contracting out freed the doctor from his obligations under his contract.

The motion was carried.

Minister's Unilateral Power

Dr. KNOX (Tynemouth) moved: "That the Minister's unilateral power to alter the terms of service is not acceptable to the profession."

Dr. Knox said he again wanted to know where the profession stood. In his view there should be a contract which was binding on both sides. It was true that the Minister could change the contract only "after consultation with the profession," but that did not mean after agreement with the profession.

Dr. KENDRICK (Nottingham County and City) opposed the motion. What the profession accepted was irrelevant, he said. What mattered was that doctors had stupidly signed a contract with the Minister in which the Minister could alter the terms of service without the agreement of the other party. It was quite legal and the doctors had been stupid enough to accept it.

Dr. CAMERON, in reply, said that under the new terms of service if the Minister put forward proposals which were unacceptable, the profession was at liberty to say they were unacceptable and that it was not prepared to carry on in the N.H.S.

Dr. SHERLOCK (East Suffolk) pointed out that the Minister's power could not be abrogated by the Minister or by anyone else.

The motion was carried.

Under-doctored Areas

Dr. CAMERON moved that paragraphs 79-81 of the G.M.S. Committee's report dealing with the special problems of acutely under-doctored areas be approved.

Dr. K. HACKETT (Wolverhampton) moved: "That, except where a request is made by an executive council to the Medical Practices Committee, all executive council areas should be 'classified' as a whole and not subdivided."

He asked leave of the Conference to insert after the first word "That" the words "in urban areas." The Conference agreed.

Dr. Hackett informed the Conference that Wolverhampton was divided into four areas for classification purposes, only one of which attracted designated area payments. The subdivision was unreasonable and irrational. Doctors in non-designated areas had patients in designated areas, and when a doctor left a designated area the repercussions were felt in practices all over the town.

Dr. MAIDEN (G.M.S. Committee) said that all executive councils were seeking to "display their wares" in the most suitable package in order to get the most money for the maximum number of doctors. That was fair enough, but it was important that the areas should be reasonable in size. Instability in designated areas must be avoided, and their size should not be too small. The Medical Practices Committee, of which he was chairman, thought in terms of 20 doctors as a minimum. There would be a better distribution of the money if areas were fairly large.

Dr. Maiden said that the whole question of payment for designated areas must be reviewed, but while the existing position remained it would be well not to have the Act altered.

Dr. G. M. TURNER (West Bromwich) said that West Bromwich had been asked to consider dividing its area into small groups of 15 to 20 general practitioners. That was thought to be the thin end of the wedge. It could be shown in West Bromwich that, though the figure was something like 4,500 patients per doctor, the area was over-doctored.

Dr. CAMERON said that if the motion were carried—and on balance he thought that it should be—it would go to the Medical Practices Committee.

The motion was carried.

Dr. G. MARTIN-JONES (Merthyr Tydfil) moved: "That the present method of assessing the under-doctoring of areas and work load of general practitioners is fallacious."

He said that the criterion based on calculation of lists was entirely fallacious. Doctors in Merthyr Tydfil were turned down on the figure of 2,505, which was only five over the figure required. He suggested the following criteria in evaluating an index or "points system": The Ministry of Social Security index; the average age of doctors in the area; the health of doctors in the area; the dependence of local hospitals and the public health service on general practitioners in the area; the demand of industrial concerns on general practitioners; the average number of contacts between patients and doctors; the number of patients aged over 60; the number of patients aged under 5; the total number of prescription forms; and the amenities of the area.

Dr. H. F. V. RIDDLE (Fife) said he came from an area which was partly industrial and partly rural. There had recently been a resignation in the industrial part leaving two doctors with something like 11,000 patients to look after. In the desirable, rural part of the area, where the doctors had their own cottage hospital and looked after a large number of patients, it had been possible to show that they were doing the work of an extra doctor between them, and on those grounds the area had been designated.

Dr. CAMERON accepted the motion, which was carried.

Health Centres

Dr. SMITH (North-east London) moved:

> "That, while not wishing to detract from any other form of practice, this Conference welcomes the Minister's response to the increasing demand of general practitioners for the opportunity to practise in health centres. Local medical committees, executive councils, and local authorities are requested to take all necessary steps to expedite provision of health centres for those doctors who wish to practise from them and to fully consult the practitioners concerned at the earliest possible stage of planning."

An amendment to insert the words "hospital authorities" after the words "executive councils" was carried.

Dr. SMITH said there was, and should be, variety in the methods of practice. Whatever form of practice a doctor had it was difficult for him to cope with the work load and to maintain satisfactory standards, but a rapidly increasing number of doctors were coming round to the view that when doctors worked as part of a team their difficulties were fewer. An increasing number of doctors considered that health centres provided a satisfactory vehicle for the work of such teams.

He recognized that many doctors would not accept that, and it was not the purpose of the motion to impose health centres on those who did not want them. The object was to ensure that doctors who wanted to work in health centres would be given the opportunity to do so.

Dr. RONALD GIBSON (Chairman of Council) said he opposed the motion not because he disagreed with it but because, in his view, it did not go far enough. He was concerned about the future of health centres. He had no doubt that they would play an increasing part in general practice, but not at the expense of urban and rural single-handed and group practitioners who were already properly housed, equipped, staffed, and sited. During his tour of the country he had encountered at least one group practice which had been disturbed by the possibility of a health centre being built literally across the road.

It was not sufficient merely to look at one aspect, said Dr. Gibson. In his view a complete appraisal of every facet and implication of working in a health centre should be asked for. There was the implication of a mass withdrawal from the Service, and the possibility or impossibility of a no-detriment clause to be considered. There was the question of security of tenure. But while doctors were thinking about these things health centres were being built.

It was not enough to talk about co-ordination and discussions between doctors. Dr. Gibson pleaded with the Conference, even though it might carry the motion under discussion, to carry unanimously a motion, appearing later in the Agenda, that called for a total investigation into all the implications of doctors working in health centres in the future.

Political Interpretation

Dr. SPEAKMAN (Liverpool) said he opposed the motion for one reason—namely, that he did not welcome the Minister's response. In his view the Minister's response had been so rapid that it was suspicious and spelt danger to the profession. "I think that the Minister is putting a political interpretation on health centres as opposed to a strictly medical interpretation," continued Dr. Speakman. "I have every sympathy with doctors who want to work in health centres, but would implore them to read E.C.N. 602 before they do anything."

Dr. ARTHUR (Gateshead) urged the Conference to reject the motion. It was dangerous, he said. He agreed with the Chairman of Council that the question of health centres should be looked into, but to press for the wholesale establishment of health centres was dangerous. Ever since 1948 practitioners had had to fight for their rights, and for many years their only weapon had been their independence. That independence was in turn dependent upon their owning the tools of their profession and their own premises. "Have health centres by all means," concluded Dr. Arthur, "but for goodness' sake own them yourself."

Dr. RIDDLE (Fife) supported the motion. There were many general practitioners who sincerely believed that they could practise better medicine in health centres, he said. Indeed, some 10% held that belief, and it was to be hoped that Conference would give them the backing they needed.

Dr. A. B. AISTROP (Brighton) suggested that the motion was most diabolically political. The words were ". . . this Conference welcomes the Minister's response to the increasing demand of general practitioners . . ." The Minister started it before he ever came into office. Before the Charter was negotiated the Minister was planning the setting up of health centres.

As to the "increasing demand of general practitioners," said Dr. Aistrop, one executive council magazine contained an analysis of inquiries made of general practitioners in different areas, and the number wishing to go into health centres greatly decreased when information on what it entailed was available.

A motion that the question now be put was carried.

Dr. SMITH (North-east London), in reply, rejected outright the suggestion that there was anything necessarily political about wanting health centres. There was nothing more political about wanting health centres than about not wanting them, he said. There was a rapidly increasing interest in health centres. Dr. Gibson had referred to security of tenure, but there was nothing in the motion urging doctors to go into health centres and accept bad contracts.

The motion was lost by 89 votes to 72 votes.

Dr. P. A. T. LOWDEN (Hampshire) formally moved: "That the British Medical Association be requested to issue a comprehensive memorandum on health centres."

He accepted an amendment, which was carried, that the words "British Medical Association" be deleted and the words "General Medical Services Committee" be substituted.

A further amendment, to add the words "when the N.H.S. is removed from direct political control," was not carried.

The motion, as amended, was carried.

Health Centre Tenancies

Dr. G. HIRST (South-west London and Surrey) moved: "That this Conference asks the G.M.S. Committee to safeguard the future independence of the profession by ensuring that health-centre tenancy agreements for practitioners shall be independent of the contract for services between executive councils and practitioners."

Dr. Hirst said that the Minister had promised some 500 health centres in the next 10 years. That would cover about 25% of general practice. The important point was not whether a health centre was a congenial place from which to practise medicine but whether practising from a health centre destroyed professional freedom. In the event of a disagreement between the profession and the Minister doctors practising from health centres would have no opportunity of withdrawing their services. If the Minister thought that health centres were desirable he should not offer them to the profession with strings attached.

Dr. B. D. MORGAN WILLIAMS (G.M.S. Committee) pointed out that the tenancy of a health centre would be a contract between the local health authority and the executive council, but if a doctor resigned from the service he would be in danger of eviction. That being so, health centres would be a menace to the health of the country. The health of the country depended on the efficiency of the profession and on the willingness of general practitioners to resign en bloc but still to be in the position to continue to provide medical services to the patients. If the contract was accepted in its suggested form, it would increase the doctors' reluctance to resign from the service. Dr. Morgan Williams suggested that if no changes were made in the contract the G.M.S. Committee should advise all practitioners to refuse to work in the premises provided. "We should continue to press for enough remuneration to own our own premises and ensure the health of the country by maintaining what is left of our independence."

Dr. OUTWIN (Doncaster) moved an amendment that the words "and Finance Corporation agreements" be inserted after "tenancy agreements." He submitted that the same principles applied to loans from the Finance Corporation as applied to health centres.

The amendment was carried.

Dr. F. C. RUTTER (Norwich) suggested that the profession could not afford to wait for a comprehensive memorandum. Norwich wanted to put up health centres in development areas, and here they would be in direct competition with established practices. A number of doctors were interested in going into health centres, but they thought it necessary to have a lease with the local health authority for at least 20 years, with the option of renewal.

"Licence to Practise"

Dr. A. M. FREEMAN (Middlesex) suggested that it would not be a tenancy agreement but a licence to practise. There had been a recent conference on health centres in London at which it was stated that a 30-year tenancy would be offered. The Ministry's document specified that there would be three months' notice in the event of resignation from the N.H.S., and among other conditions imposed by the Minister was one that would either involve a restriction of private patients or a close inquiry into practice income and expenses in order to determine the proportion which came from private practice. Dr. Freeman urged Conference to support the motion.

Dr. CAMERON said that representations had been made to the Minister to see what extension of security of tenure could be obtained, but the most that the profession's representatives had achieved was three months' notice and sufficient time, at the discretion of executive councils, to allow a doctor to make alternative arrangements. Dr. Cameron had pointed out to the Minister that that would be unacceptable to the profession, and general practitioners would be advised not to sign a contract unless greater security of tenure was offered. That remained the position.

Dr. Cameron said that it was doubtful whether a comprehensive memorandum could be produced for some months. He advised general practitioners to send any draft contract they contemplated signing to the G.M.S. Committee so that legal advice could be obtained on it. The Committee's own draft contract was being drawn up by its legal advisers, and it was hoped to issue this soon. The Finance Corporation circular insisted that a practitioner must be substantially employed in the Health Service, but if he had a large private practice it would be taken into consideration in fixing the rent.

Dr. KENDRICK (Nottingham County and City) opposed the motion. There were already many doctors negotiating and signing agreements with executive councils without taking legal advice, he said. There was no need to wait for a comprehensive memorandum. Doctors in the Cleckheaton health centre had negotiated an agreement which preserved certain rights should there be a change in the functions of the health centre. The doctors would have a say in the planning and siting of any new centre, which they insisted must be provided before they could be evicted from the first centre. The G.M.S. Committee should issue a warning notice to all practitioners immediately, stressing the importance of obtaining legal advice.

The motion, as amended, was carried.

Areas of New Development and Redevelopment

Dr. CAMERON moved that paragraph 92 of the G.M.S. Committee's report dealing with areas of new development and redevelopment be approved.

Dr. SPEAKMAN (Liverpool) moved the following amendment:

> "That the G.M.S. Committee will make representations to the Minister of Health that, where a local authority has failed to give a general practitioner or a group of general practitioners full and adequate opportunity to state his or their case in relation to dispersal of his or their practices or the siting of his or their practice premises in areas of redevelopment, all general practitioners in such areas shall receive compensation until a satisfactory agreement is reached and that this compensation shall include the maintenance of the level of their income at the level no less than it was on the date when the local authority's redevelopment or development plans begin to cause an outflow of population."

The purpose of the amendment, he said, was to give protection to the doctors in areas where local authorities went ahead with development plans without consulting the local doctors.

Dr. CAMERON said that the G.M.S. Committee was collecting evidence of cases where doctors had been severely hit in areas of redevelopment. If local medical committees would send in details of such cases, they could be taken up with the Ministry.

The amendment was carried. The motion, as amended, was carried.

N.H.S. Regulations

Dr. CAMERON moved that paragraphs 93–96 of the G.M.S. Committee's report dealing with N.H.S. (General Medical and Pharmaceutical Services) Regulations, 1966, be approved.

Dr. G. H. LLOYD (Devon and Exeter) moved the following amendment: "That, in the view of this Conference, the names of doctors seeing patients by appointment should not be specially marked in the lists of National Health Service doctors prepared by local executive councils and made available to the public."

Dr. Lloyd said that his local medical committee understood that if general practitioners who offered appointments systems had a special star against their name in public notices it was tantamount to advertising, and guidance was sought on this matter.

Dr. KUENSSBERG (G.M.S. Committee) suggested that such guidance should not be sought through a formal motion. The local medical committee could obtain the information from its representative, since the G.M.S. Committee had discussed the matter and it had seen no reason why general practitioners offering appointments systems should not be indicated in the executive council lists.

Dr. B. L. ALEXANDER (G.M.S. Committee) said that general practitioners had fought for the right to have an appointments system. Surely it was reasonable for a doctor to be able to indicate that he had such a system. To pass the motion would be a retrograde step.

Dr. CAMERON said that the question was under consideration by the Central Ethical Committee.

A motion to pass to the next business was carried.

Service Committees and Tribunal Regulations

Dr. MAIDEN took the chair in order to allow Dr. Ridge to present the report of the G.M.S. Committee's Working Group on Service Tribunal Procedure, of which he was chairman.

Dr. RIDGE moved that paragraphs 97–109 of the G.M.S. Committee's report dealing with N.H.S. (Service Committees and Tribunal) Regulations be approved.

He recalled that for years there had been motions on the Conference agenda criticizing service committees and tribunal procedure, calling for the abolition of the committees, and so forth. When the Fraser Working Party was set up its terms of reference had been to identify the cause of unrest in general practice, and to seek solutions and to make recommendations. Unfortunately, just when the working party's commentary was to be published the working party had come to an end, and its commentary on disciplinary machinery was never published. The Charter had demanded a drastic overhaul of the disciplinary machinery. A working group was set up, and it had produced a document for the negotiators which had the unanimous approval of the defence societies.

After the adoption by the Conference last year of the joint reports of the negotiations on the Charter as a basis for a new contract the working group was reconvened, and it enlisted the aid of legal experts and representatives of the defence societies. Dr. Ridge emphasized that, having studied the relevant paragraphs in the third joint report, the defence societies had declared that they were satisfied with the proposals. Nevertheless, the G.M.S. Committee had received expressions of disquiet from several local medical committees, executive councils, and B.M.A. Divisions, and it had re-examined the whole matter. After a long debate, and by a substantial majority, the Committee had decided to proceed with the proposals in the third report.

Unacceptable Proposals

Dr. A. C. DAWES (Warley) moved an amendment: "That this Conference considers that the proposals in the Third Report of Joint Discussions on the Family Doctor Service with regard to regionalization of medical service committees are unacceptable, and asks that the matter be referred back to the G.M.S. Committee for further consideration of all the implications involved."

Dr. Dawes said that some areas had managed to make the existing provisions work satisfactorily and others had not. In the view of his local medical committee the existing scheme should be amended to meet the needs of those who were dissatisfied. "The devil you know is always better than the devil you do not know," said Dr. Dawes, "and to introduce an absolutely new scheme is a dangerous experiment."

If the proposals for regionalization were implemented for years ahead the G.M.S. Committee would be busily amending the loopholes. It would be far better to amend the existing scheme to make it satisfactory. He failed to see what the opinion of the defence societies had to do with the Conference. The matter needed far more consideration, and he urged the Conference to refer it back to the G.M.S. Committee.

Dr. J. R. MILES (Gloucester County and City) supported the amendment. Time after time the local knowledge of members of a service committee had helped to avoid a miscarriage of justice. Dr. Miles did not think the appointment of a legally qualified chairman was a good thing. "If you have to be clobbered, it is much better to be clobbered by your own pals than by some civil servant in the next county."

Dr. M. R. SHERIDAN (Middlesex) opposed the amendment. Many general practitioners had had difficulty not only in dealing with uninformed lay members of service committees but uninformed chairmen, he said. Furthermore, in some executive councils almost every doctor was either a member or deputy member of the medical service committee. That led to invidious situations. A legally qualified chairman was a "must," in Dr. Sheridan's view.

Dr. H. N. ROSE (G.M.S. Committee) said that he spoke against the general view of the

G.M.S. Committee. He thought that in the proposals two essential safeguards were lost. One was the right to appoint the chairman of the medical service committee. Once the Minister was allowed to appoint the chairman general practitioners would not be able to appoint another one if they so wished. Secondly, if there were seven medical members of the executive council on the medical service committee they could get its recommendations modified by the executive council when they thought an injustice had been done. Furthermore, there were lay members of executive councils, and it was necessary to preserve their good will if medical service inquiries were to operate in a proper manner. The executive councils were against the proposition.

Independent Tribunal

Dr. I. M. JONES (G.M.S. Committee) opposed the amendment. It was, he said, a basic principle of justice that those sitting in judgement should be completely independent. The proposal for regionalization ensured that the majority of the tribunal would have no connexion with the case. Further, if the tribunal contained one layman and one doctor from the executive council area concerned the need for local knowledge was fully met.

It was important, said Dr. Jones, that there should be the maximum opportunity for relieving anxiety by the dismissal of a case at the earliest opportunity. That would be partly achieved by having legally qualified chairmen. It was equally important that a doctor who was arraigned should be able to count on getting justice.

Dr. A. M. READ (Portsmouth) asked the Conference to support the amendment. Before any changes were made in the existing procedure the views of all local medical committees should be canvassed so that the G.M.S. Committee could ascertain the amount of dissatisfaction with the present procedure.

Dr. G. JOLLY (Carlisle) said that his local medical committee was anxious to see "the end of this nonsense." It thought that, in a small area particularly, political considerations entered far too much into the matter, and too much pressure was apt to be put on a local chairman, who was placed in an impossible position. Carlisle wanted to see the matter taken as far away from local chairmen as possible.

Dr. R. W. RAE (G.M.S. Committee) said that, in his view, it was unnecessary to go to the lengths of setting up regional committees to rectify faults in the existing system. It was assumed that medical members attended the service committee hearings with an unbiased mind, and it had to be assumed that lay members did likewise. Therefore, it made little difference how the service committees were composed. He thought it would be better to leave matters as they were.

Dr. C. J. WELLS (G.M.S. Committee) suggested that a number of red herrings were being dragged across the debate. It had been said that executive councils resented a most important procedure being taken away from them. The Conference was not discussing the convenience of executive councils. It was discussing those unfortunate members of the profession who were arraigned before a service committee. "I think you would do a great disservice to your fellow practitioners were you to pass this amendment, because these are the ones for whom we have already a responsibility, and for whom we should do our best whenever we can."

Dr. WHOWELL (Leicestershire and Rutland) said he supported the amendment. His committee had written to every executive council in the country asking for their views and there had been over 20 replies strongly in favour of continuing the existing system. No replies had been received against. To state that it was necessary to consider only professional colleagues in the matter was scandalous. Justice must be done to all sides, and the existing system ensured this.

Securing Justice

Dr. RIDGE said that the endeavour was to secure that justice was done, and, more important, to secure that a very large number of doctors each year were not subjected to the anxiety of being involved in a formal service committee inquiry when there was no need for it.

The size of the problem was known exactly. In 1964 there had been 676 complaints. Of those 317 had been dismissed without a hearing. Yet those 317 doctors had had to suffer anxiety. Of the 359 hearings breaches had been found in only 118 cases, and of those breaches only 51 had been sufficiently serious to warrant a financial penalty. In the majority of cases —running into thousands—over the last eighteen years the defence societies had been involved and that was why their views were relevant.

The Ministry and the G.M.S. Committee thought that the Minister should nominate a chairman for appointment by the executive councils in the region, and the Minister would discuss the appointment with the Lord Chancellor. The appointment would normally be for one year, with the proviso that at the outset the initial appointment might be for longer. The Minister would consult the G.M.S. Committee about appointments and reappointments. There would be no deputy chairmen. Dr. Ridge assured the Conference that the G.M.S. Committee would not agree to anything in the way of new arrangements unless it was satisfied that they would be acceptable.

Judge, Jury, and Executioner

Dr. DAWES (Warley), in reply, said that it would be wise to refer the matter back to the G.M.S. Committee in order to provide a breathing space before regionalization came into effect, and time to see how the new Terms of Service were working. Under the regionalization proposals the Minister would nominate the chairman; would appoint the members of the service committee, apart from one medical and one lay member from the executive council; and would be the final court of appeal. He would, in effect, be judge, jury, and executioner, said Dr. Dawes.

The amendment was carried.

Dr. DAWES (Warley) moved a further amendment: "That this Conference considers that the chairman of a medical service committee should not be appointed by the Minister of Health, but should be elected by the executive council to which the committee is responsible, as at present."

He said the amendment was intended to ensure that a medical service committee was presided over by a chairman who had the confidence of the local people.

Dr. RIDGE said that the motion contained one glaring inaccuracy, that the service committee was responsible to the executive council. That was not so.

A motion to pass to next business was carried.

Dr. N. E. NATHANSON (Birkenhead) moved an amendment: "That, in the event of the new service committee procedure not coming into operation, the provision that complaints be considered informally by an *ad hoc* committee be added to the present procedure."

In the view of his local medical committee the most important part of the new proposals was that before any formal service committee procedure was brought into action there should be the most rigorous efforts to avoid it. That could well be done by an informal conciliation procedure.

Dr. A. WHITEWRIGHT (Bolton) suggested that an effort was being made to make a new law for a few bad cases.

Dr. RIDGE said that if Dr. Nathanson would withdraw the phrase "*ad hoc* committee" the amendment would be acceptable.

Dr. NATHANSON and the Conference agreed to the withdrawal of those words, and the amendment was carried.

Dr. DAWES (Warley) moved an amendment: "That this Conference considers that, while it is very desirable for the chairman of a medical service committee to be legally qualified, the proposals for reform of the machinery for hearing complaints against general practitioners should strongly recommend this qualification but not make it obligatory."

He pointed out that in some areas a legally qualified chairman might not be available, therefore the appointment of a legally qualified chairman should not be made obligatory.

Dr. RIDGE said that the amendment was in accordance with paragraph 40 of the third report.

The amendment was carried.

A further amendment standing in the name of Warley, to the effect that in the event of the chairman of a medical service committee not being legally qualified he should have wide experience of tribunal work, was carried without discussion.

Conciliators

Dr. E. PARKINSON (Dorset) formally moved an amendment: "That this Conference welcomes the formal recognition of the type of conciliatory work which has been successfully carried out for a number of years in many areas by clerks of executive councils, but instructs the G.M.S. Committee to make representation to the Minister of Health to ensure that each executive council shall have the option, in consultation with the local medical committee, to appoint as its conciliator either a lay member or the clerk of the executive council."

Dr. J. A. LEARNER (Derby) said that presumably the proposals in the third report for the appointment of a member of an executive council to act as conciliator arose because of unsatisfactory situations in some areas. In other areas, such as his own, the clerk and his staff had acted as conciliator for many years with complete impartiality and to everybody's satisfaction. When a local medical committee was satisfied the existing situation could remain undisturbed, but in areas where the committee was unhappy it could request the appointment of a member as conciliator.

Dr. Ridge referred the Conference to paragraph 36 of the third report which, he said, precisely covered the situation.

The amendment was lost.

Dr. Dawes (Warley) moved the following amendment:

> "That this Conference recommends that reform of the machinery for hearing complaints against general practitioners ought to provide that (1) the procedure to be adopted before, during, and after the hearing of a complaint is sensible, fair, and equitable to all parties concerned, and is adhered to in all areas as a standard practice; (2) the chairman of a medical service committee should have the right to view the initial documents of complaint and response, and be vested with power to reject those instances where a reasonable prima facie case is not implied by their content; (3) in the event of a formal hearing being decided upon, the practitioner against whom the complaint is made should have the right to be legally represented if he so wishes; (4) an appeal against the decision of the Minister of Health to a suitable higher authority should be possible, with proper safeguards against misuse; and (5) when the report of a service committee is sent by the Ministry to the G.M.C. the warning letter sent to the practitioner concerned should include not only the advice to consult his defence body before making a reply, but also to notify the secretary of his local medical committee that he has received a warning notice, so that the latter committee may advise the practitioner wherever possible."

A motion to pass to next business was put and carried.

Preserve Status Quo

Dr. Speakman (Liverpool) moved an amendment: "That in any alteration in medical service committee procedure the right of any local medical committee (with their executive council) to keep the status quo should be preserved."

He said the motion asked for justice for all local medical committees. Each local medical committee should be allowed to retain the status quo if it wished to do so.

Dr. Ridge said that the proposals in the third joint report did not concern procedure at all. They concerned solely the setting up and the election of chairmen. There was no suggestion that service committee procedure should be in any way amended.

The amendment was lost.

Dr. Dawes (Warley) moved an amendment: "That this Conference recommends that the mode of formation of medical service committees at present in use be continued, and that, suitably amended, it be made the basis for the formation of medical service committees in the family doctor service."

He said the amendment tied up the whole matter and made clear the decision of the Conference that it wanted a continuation of the existing procedure suitably amended to correct obvious shortcomings and to provide a medical service committee procedure acceptable to all.

A motion to pass to next business was put and carried.

Reimbursement of Expenses

The following motion by Inner London, incorporating an amendment by Denbigh and Flint, was formally moved and carried: "That a general practitioner who suffers the hardship of appearing before a medical service committee and is subsequently found not to be in breach of his terms of service should receive complete reimbursement for the expenses incurred in attending the committee, including the fee of a locum tenens. Reimbursement should also be made to general practitioners of expenses incurred in attending all N.H.S. (Service Committee and Tribunal Regulations, 1956) investigations."

At this point Dr. Ridge resumed the chair.

Forward Planning

Dr. Cameron moved that paragraphs 110 to 111 of the G.M.S. Committee's report dealing with forward planning be approved.

Dr. Ruffell (Kent) formally moved: "That this Conference requests the General Medical Services Committee to seek a re-appraisal and reorganization of the National Health Service in the light of current social conditions and of current available medical manpower. For this purpose it requests that the team of negotiators be broadened."

Dr. Noble (G.M.S. Committee) reminded the Conference of the unanimous decisions of the G.M.S. Committee and of the Council, supported by the Medical Practitioners Union: "(*a*) That the General Medical Services Committee believes that the present method of financing and organizing medical care in Great Britain requires re-examination and reassessment in the best interests of the community. (*b*) That the Committee is of the opinion that the Government should be requested to set up immediately an independent inquiry into the finance, administration, and staffing of the National Health Service." That request had gone to the Prime Minister, but no reply had been received so far.

The motion was carried.

A motion by Sunderland, that the N.H.S. should be removed from political control and vested in a public corporation which would administer the affairs and finances of the Service, and that the corporation should be empowered to take whatever steps it deemed necessary to make the Health Service a viable economic concern, was, by leave, withdrawn.

Dr. R. Hewitt (Salford) formally moved: "That this Conference deplores the lack of direct Government finance actively to promote the development of general practice and urges the Government to make immediate provision to provide general practitioners with the necessary facilities for improving the Health Service consistent with modern standards."

Dr. Cameron accepted the motion, which was carried.

Work Load

Dr. Cameron moved that paragraphs 112 to 114 of the G.M.S. Committee's report dealing with the work load of general practitioners be approved.

Dr. K. Hackett (Wolverhampton) moved: "That financial contribution by the patient at the time of service is essential to the maintenance of an efficient family doctor service."

The country could not afford the National Health Service, he said. There were still many doctors who were obliged to practise "soup kitchen" medicine, with two- to three-minute consultations, intuitive diagnosis, and blunderbuss therapy. It was the result of attempting to run family doctoring on a shoestring. The time had come when the provision of medical care must not be entirely a public responsibility. Part of it must be an individual responsibility. To ask a patient to contribute at the time of service would relieve the Chancellor of a responsibility which he could not fulfil and would restore a financial link between patient and doctor, thereby reducing frivolous demands upon the doctor's time.

Dr. F. C. W. Royle (Southampton) pointed out that the political climate was changing, and if the motion was passed it would show the Minister that it was what the profession wanted.

Dr. H. Glyn Jones (G.M.S. Committee) said it was fairly easy for a patient to pay the general practitioner at the time of his service but it was a very different matter when it came to hospital treatment. It would be an impossible state of affairs in which a patient paid his general practitioner but could go to the casualty department of the general hospital and receive free treatment.

A motion that the question be now put was carried.

The motion was carried by a large majority.

Dr. D. Gwyn Jones (Cardigan) moved: "That this Conference is of the opinion that nothing has been done to reduce the work load on general practitioners since the implementation of the Charter."

He said that during the last 12 months the work load had greatly increased.

Dr. Sheridan (Middlesex) moved an amendment to insert after the word "nothing" the words "material nor sufficient."

The amendment was carried, and the motion, as amended, was carried.

The following motion in the name of North-east London, moved formally, was carried: "That, because of the still serious situation in general practice, particularly with regard to the work load, patients should be expected wherever possible to attend surgery rather than to request home visits. The Conference strongly urges the Minister to take effective steps to achieve this objective."

Similarly, the following motion by Dundee was also carried: "That publicity be brought to bear on the working population to inform them that the deduction made from their pay packets for their 'National Health' stamps only pays for their general medical services in very small measure."

Dr. J. H. Marks (Hertfordshire) formally moved: "That the public ambulance service should be available to bring non-ambulant patients to general practitioners' surgeries."

Dr. G. D. Bolsover (Oxford County and City) moved as an amendment the addition of the words "and that the Minister should be urged to review immediately the whole problem of transporting non-ambulant patients to their doctor's surgery."

Dr. Webb (Ipswich) said that in Ipswich the ambulance service brought patients to doctors' surgeries as and when necessary. He advised representatives not to make an issue of the matter at the present juncture but to try to get their medical officers of health to provide the service.

The amendment was carried.

Dr. CAMERON said that this was a service that was certain to come about, and would probably be available in rural areas first. The sooner it was adopted as policy the sooner the G.M.S. Committee could begin discussions with the Ministry on the matter.

The motion, as amended, was carried.

Statistical Report

Dr. R. CONDIE (Midlothian, West Lothian, East Lothian and Peebles) moved: "That the G.M.S. Committee be instructed to produce a statistical report of the work load of general practitioners."

Dr. Condie said it might be argued that a comprehensive study of the work load in general practice had been done in the past. That was true to some extent, but the findings of various investigations had differed so widely that the Review Body in its Seventh Report had had to admit that it was difficult to base firm conclusions on them.

Dr. Condie said he had no illusions about the difficulties. Work load varied from practice to practice, from month to month, and from year to year. However, he was sure that had the profession been able to produce convincing evidence on work load for the Review Body on the last occasion it might have received a more sympathetic hearing. The proposed survey would give a base-line from which to judge figures obtained from similar studies in the future.

Dr. SHERLOCK (East Suffolk) was opposed to the motion. To carry it out, he said, would be too expensive and too time-consuming, and in any event doctors knew what their work load was.

Dr. W. O. WILLIAMS (Swansea) supported the motion, but pointed out that statistical evidence did not come down like manna from heaven. Wild guesses and opinions were a poor substitute for proper research. A detailed study of the work of the family doctor was being made in South Wales, and the G.M.S. Committee should actively support and encourage such projects.

The motion was carried.

Certification

Dr. CAMERON moved that paragraphs 115 to 116 of the G.M.S. Committee's report dealing with certification be approved.

Dr. WEBB (Ipswich) moved: "That this Conference considers the issuing of National Health Insurance certificates should not be a part of the general medical services provided by the National Health Service."

Dr. ARTHUR (Gateshead) said that certification had been simplified and more could be done. But he opposed the motion. As a general practitioner he was responsible for his patients, and if he was not to be the one to decide whether his patient was fit for work he would like to know who should.

Dr. CAMERON agreed that some progress had been made in the matter of certification but it was a difficult task, because so many people were involved. He asked the Conference to leave the matter to the G.M.S. Committee to carry out by stages.

Dr. WEBB (Ipswich), in reply, said that one of the objects of the motion was to try to raise the self-respect of the British employee by putting on him the responsibility of being honest.

The motion was carried.

Vocational Training and Continuing Education

Dr. CAMERON moved that paragraphs 117 to 120 of the G.M.S. Committee's report dealing with vocational training and continuing education be approved.

A motion by North-east London, that the Conference requested those responsible for medical education to see that more emphasis was placed on the importance of general practice as a potentially worthwhile career, was carried.

Dr. J. S. HAPPEL (G.M.S. Committee) informed the Conference that considerable progress had been made in the subject. In May the General Medical Council had approved recommendations on the curricula of medical schools for the next ten years, and general practice figured prominently in them.

Dr. H. S. HOWIE WOOD (G.M.S. Committee) moved: "That this Conference calls upon the General Medical Services Committee to collaborate with the Royal College of General Practitioners and the Ministry of Health in postgraduate educational activities for the general practitioner."

He pointed out that certain rewards had been offered to general practitioners who received some postgraduate instruction, but in practice it was not working out. Many general practitioners were attending a large number of lectures for which they would get no proper reward. As an example, Dr. Howie Wood instanced a full day's postgraduate course held in Winchester last December. At the end of the day those who attended were informed that the course had not been given prior approval so therefore no credits could be given. A request had been made six weeks before for one lecture to be recognized, but the Ministry had dragged its feet and after the lecture had been given the practitioners concerned were informed that no retrospective recognition could be given.

The motion was carried.

Dr. POLLACCHI (Dunbartonshire) moved: "That this Conference is of the opinion that regulations to permit a period of sabbatical leave of six months in each five-year period in general practice should be introduced, to enable general practitioners to broaden their experience in the medical and paramedical sciences."

He said the motion was to give the doctor something to look forward to. It gave him an opportunity to carry out some research in which he had an interest, and which would be to the benefit of himself and his patients.

The motion was carried.

Obstetric Courses

Dr. P. L. CONSTANTINE (Essex) moved: "That this Conference is of the opinion that continuing obstetric education courses for general practitioners should be conducted in designated postgraduate institutes which are academically incorporated into the university establishment, and calls for the initiation of discussions to that end."

He said that regrettably there had been little or no progress towards securing the necessary academic staff, facilities, and status for regional postgraduate obstetric centres. Those who had attended the residential course at Chelmsford would appreciate the need for adequate facilities. The Ministry recognized the desirability of those refresher courses. Attendance at them at intervals was one of the requirements for retention on the obstetric list. It was therefore difficult to understand why the Ministry's and universities' recognition had not been obtained.

The total number of doctors attending the course at Chelmsford in one year was greater than the number attending the courses at the "Mecca of obstetrics, Queen Charlotte's." Every month there was a perinatal conference at Chelmsford attended by the hospital staff and up to 50 local general practitioners. Once a year a weekend seminar was held at which distinguished consultants were present. That sort of work required time, money, and staff. Only by full recognition could those be obtained, and that question should be treated urgently. Dr. Constantine asked the Conference unanimously to support the motion.

Dr. CAMERON said that several times the profession's representatives, accompanied by Dr. David Brown, had been to the Ministry on the subject. If the Conference carried the motion it would give an opportunity of going back and reopening the whole problem.

The motion was carried.

Reimbursement of Expenses

Dr. A. M. FREEMAN (Middlesex) moved: "That direct payment for locum expenses for attendance at refresher courses should be restored."

Dr. CAMERON said he had sympathy for the motion, and it was something which the G.M.S. Committee could look at again. He reminded Conference, however, that on the previous day it had asked the Committee to get the basic practice allowance itemized.

A motion to pass to next business was carried.

A motion in the name of Berkshire, urging that reimbursement towards locum fees be continued when a doctor attended more than the minimum session requirements for qualification for basic practice allowance, etc., up to the previously accepted maximum of 22 sessions per annum, was, by leave, withdrawn.

Dr. MARKS (Hertfordshire) moved: "That a standard rate, applicable to general practitioners and consultants, be determined in respect of travelling allowances for attendance at refresher courses."

An amendment to delete the last five words, "for attendance at refresher courses," was carried.

Dr. Marks pointed out that general practitioners doing different types of work were paid at different rates though using the same car.

Dr. GLYN JONES (G.M.S. Committee) asked the Conference to reject the motion, which, he said, was dangerous. There was a standard rate for travelling in the hospital service which had been agreed under the Whitley procedure, and it covered all employees of the hospital service. It was in fact one farthing a mile more than it was 15 years ago. The rate had been regarded by the Central Consultants and Specialists Committee as unsatisfactory. If the motion was carried the Conference would be agreeing with the rate which the C.C. and S. Committee disapproved of.

The motion was lost.

Rural Practice

Dr. J. S. HAPPEL (Chairman of the Rural Practices Subcommittee) moved that paragraphs 127 to 132 of the G.M.S. Committee's report, dealing with rural practices, be approved.

Referring to his predecessor in the chair, Dr. C. F. R. Killick, Dr. Happel said that he had been a member of the Rural Practices Subcommittee for the past 20 years and its chairman for 17 years. He had served the Subcommittee well and faithfully. At the Ministry he had been "a tiger in the interests of rural practitioners." He had served for 13 years on the Government's mileage committee, and it was owing to his personal efforts that the Rural Practices Fund had remained almost intact. For those and all Dr. Killick's many other services to the profession the Conference would no doubt be glad to pay tribute. (Applause.)

On taking over the chair, Dr. Happel said he had found that his tasks fell into three parts. Firstly, to tackle the urgent problems of dispensing; secondly, the short-term question of the impending review of the Rural Practices Fund; and, thirdly, the need for a good look at the future of rural practice.

A Working Group had been set up to examine the problems of dispensing in detail, and its views were reported at several meetings with the main negotiators and with the Ministry. No more had been heard from the Ministry, in spite of a number of requests, until new proposals had been received on 24 May—some four and a half months later—and too late to put before the Conference. Dr. Happel said the Ministry's proposals were not very exciting. Preliminary consideration had been given to them, and counter proposals were being drafted in readiness for further talks. A report would be made to the profession when a decision was reached. Dr. Happel said he was grateful for the support in some of the motions on dispensing, but the Conference would understand if he asked that they be treated as references, since negotiations were going on.

When it became obvious that the talks would not be completed before the Conference met the Rural Practices Subcommittee obtained the consent of the G.M.S. Committee to have a special meeting of rural practitioners to discuss, among other things, whatever proposals might emerge. Constitutionally such a meeting could not have the power of the Conference, but he was sure Dr. Cameron would give an assurance that the G.M.S. Committee would carefully consider any resolutions passed.

Dr. Happell said that consideration of the future of rural practice had been entrusted to a working group of some of the younger members under the chairmanship of Dr. Michael Wilson. He had already commissioned some preliminary studies by individual members of the group into such things as patterns of rural practice overseas, including Europe; transport in rural areas; telecommunications; future financing of rural practice; and, last but not least, the place of single-handed rural doctors in the new contract.

A number of motions on dispensing and amendments thereto were, by decision of the Conference, referred to the Rural Practices Subcommittee *en bloc.*

Rural Practices Fund

Dr. HAPPEL moved that paragraphs 127 to 132 of the G.M.S. Committee's report dealing with the Rural Practices Fund be approved.

Dr. MANSON (Denbigh and Flint) moved that paragraph 131 of the annual report be referred back to the working group. It was, he said, disturbing to all rural practitioners to learn that it was not envisaged that any major alteration in the scheme would be necessary in 1968.

Dr. KILLICK (G.M.S. Committee) thanked Dr. Happel for his kind remarks. He had, he said, enjoyed every "battle." Referring to the amendment by Denbigh and Flint, Dr. Killick said the Conference would be amazed if it knew how many hours the Subcommittee had taken in dealing with the points raised by Denbigh and Flint. All the disputes and problems raised by that local medical committee had been investigated, and everything possible had been done to sort them out. Denbigh and Flint still had the right to appeal for the matter to be looked into again, and he suggested that was the proper course to take at the present stage.

Dr. A. J. ROWE (G.M.S. Committee) added that the question of the Rural Practices Fund had been looked at very carefully. Every local medical committee had been written to, and the replies had shown no major anomalies had arisen in the administration of the scheme. It might well be that at a later date the Fund could be administered in a different fashion, but at the moment there were no grounds for a major alteration in the mechanics of the scheme.

The amendment was lost.

The CHAIRMAN formally moved the following motion in the name of Cumberland: "That, in the event of the 10% increase in the Rural Practices Fund being found to be inadequate on revision to recompense divergencies between urban and rural practices under the revised provisions for payment of remuneration to general practitioners, any adjustment in the Fund should be retrospective to October 1966."

Dr. HAPPEL suggested there was some confusion. The amount was fixed by the Review Body.

The motion was carried as a reference to the Subcommittee.

Dr. E. PARKINSON (Dorset) moved: "That, having regard to the fact that profits from dispensing and rural practice payments constitute a financial subsidy for rural practice, the General Medical Services Committee be urged to ensure in its negotiations with the Minister of Health that any reduction in the former should be offset by a substantial increase in the latter, and in any case, remuneration under these headings should be considered in relation to each other."

Dr. HAPPEL said that the Minister had views on the subject. In the view of the Subcommittee subsidy in rural practice should be provided from inducement funds.

The motion was carried as a reference to the Subcommittee.

Planning Care in Rural Areas

Dr. HAPPEL moved that paragraph 133 of the report dealing with the planning of medical care in rural areas be approved.

Dr. A. M. SMEATON (Hampshire) moved: "That the General Medical Services Committee be invited to give special consideration to the problems of rural areas surrounding developing towns."

He said that he represented general practitioners in a market town in Hampshire which had become the victim of a "take-over bid" by the Greater London Council which would increase the population from 30,000 to 80,000 over the next seven years. One of the many problems concerned mileage payments. Until recently, 16 of the doctors in the town were eligible for mileage payments, serving a large rural area, and having at least 10% of their patients living outside the three-mile limit. Within the past year or so six doctors had fallen below the 10% and were no longer eligible for mileage payments. As the urban population increased, that trend would continue, and doctors would be more and more reluctant to accept patients living four to eight miles from the surgery. That must seriously affect the ability of patients in rural areas surrounding developing towns to get medical care, particularly from the doctor of their choice.

The motion was carried.

Maternity Services

Dr. CAMERON moved that paragraphs 134 to 135 of the G.M.S. Committee's report, dealing with general practitioner maternity services, be approved.

The following two motions, in the names of Southampton and of Devon and Exeter, were carried:

> "That when a maternity patient is transferred to hospital during labour where the general practitioner is in attendance, the full maternity service fee should still be payable."
>
> "That this Conference deplores the proposed closure of the existing general practitioner maternity units, which is against the interests of both patients and general practitioner obstetricians."

Compensation

Dr. A. N. MATHIAS (former Chairman of the Compensation and Superannuation Committee) moved that paragraphs 136 to 139 of the G.M.S. Committee's report, dealing with compensation, be approved.

He said he was presenting those paragraphs of the report with the permission of the chairman of the Compensation and Superannuation Committee, Dr. J. B. S. Morgan.

Approximately 500 repayments of compensation had been made to practitioners aged over 70, and the number of those expecting to receive compensation was set out in the report. The policy of the Committee remained unchanged, and at the appropriate moment, so soon as the "freeze" allowed, representations would again be made to the Ministry for the question of compensation to be looked at again. It was scandalous after all these years of continuous inflation that the matter still remained unresolved.

The following motions in the names of Gateshead and of Cardiff were carried:

"That this Conference reaffirms its firm adherence to the resolution of the Conference of 1966 on the subject of compensation."

"That this Conference strongly supports the action of the G.M.S. Committee on compensation. Nothing less than the proposals in paragraph 138 are acceptable."

Dr. A. B. DAVIES (Staffordshire) moved: "That this Conference deplores that even after 1972 some 3,000 doctors will still lack repayment of their compensation. The injustice to doctors at age 60 or with twenty years' service must be remedied forthwith."

He paid tribute to Dr. Mathias for the progress which had been made in the last year of his office. There were, however, still some things which had not yet been achieved, and the motion in the name of Staffordshire was an invitation to stimulate the negotiators to do even more.

The motion was carried.

Superannuation

Dr. MATHIAS moved that paragraphs 140 to 170 of the G.M.S. Committee's report dealing with superannuation be approved.

Dr. A. B. DAVIES (Staffordshire) moved: "That this Conference considers that the reply of the Minister of Health to the deputation on 12 October 1966 is regrettable. In the matter of older doctors with twenty years' service no special treatment is requested but an urgent reconsideration on both moral and actuarial grounds."

He said that again the motion was an invitation to Conference to stimulate those concerned to work even harder.

Dr. MATHIAS accepted the motion, and added that it was "a tough bit of negotiation." It was quite scandalous that the people who made the service tick for the first 10 to 12 years, underpaid and increasingly overworked, with little prospect, because of increasing years, of serving long enough to add to their pension, should be denied a backdating of the 1¾%. The Committee would press on, and when the freeze was over would go back and see what could be done in the matter.

The motion was carried.

Dr. WEBB (Ipswich) moved: "That this Conference considers it should be possible for a general practitioner to retire after 20 years' service with the pension accrued at that time."

He said that a practitioner should be able to retire in the circumstances described, and go to an underdeveloped country and do work there without prejudice.

Dr. MATHIAS said that the matter was under consideration in a much wider field by the National Joint Advisory Council of the Ministry of Labour, and the Committee had been asked to hold its horses until such time as Government policy on the whole of the report had been determined.

The motion was carried.

A motion by Cardiff, "That those doctors who opted out of the N.H.S. Superannuation Scheme in 1948 should now be given a fresh option as from 1 April 1967," was carried as a reference to the Committee.

Constitution

Dr. CAMERON moved that paragraphs 171 to 175 of the G.M.S. Committee's report dealing with the constitution of local medical committees, the Conference of Local Medical Committees, and the G.M.S. Committee be approved.

A representative asked whether a quorum was present.

The CHAIRMAN moved formally the following amendment by Cumberland: "That the election of direct representatives on the General Medical Services Committee shall be by voting power vested in individual general medical practitioners and not, as at present, by voting power vested in local medical committee members."

Dr. W. KEITH DAVIDSON (G.M.S. Committee) pointed out that at present the G.M.S. Committee was responsible to the Conference. If the retention of that situation was the desire of the Conference the motion must be rejected. The attitude of a member of the G.M.S. Committee depended on the advice and, in some cases, the instructions of his local medical committee. Under a system of direct election of the G.M.S. Committee by the periphery the policy adopted by the G.M.S. Committee would depend on the system of communications between the periphery and the G.M.S. Committee member and not necessarily through the local medical committee. Machinery existed at present, and if it were not perfect in all areas the present position might be improved. Communications, both ways, between the local medical committees and the G.M.S. Committee representative and, of course, between the periphery and the local medical committee might be improved.

The Conference had shown that it wanted to retain the right to advise and in some cases to instruct the negotiators. Passing the motion would mean that the negotiators would be directly responsible to the periphery, who elected them, and would have a diminished responsibility to the Conference.

Conference members, as far as representatives were concerned, were appointed by local medical committees, and it was quite illogical that the Conference executive, the G.M.S. Committee, should be elected differently.

The amendment was lost.

No Quorum

A demand was made, on a point of order, for the number present to be counted to determine whether there was a quorum.

A motion to suspend Standing Order 25, which stated that no business shall be transacted unless there be present at least one-third of the representatives appointed to attend, was not carried by the requisite majority.

On a count being taken, the CHAIRMAN ruled that a quorum was not present, and that the official business of the Conference terminated with the motion by Cardiff concerning doctors who opted out of the N.H.S. Superannuation Scheme in 1948.

Vote of Thanks

On the motion of Dr. SPEAKMAN (Liverpool) a vote of thanks to the Chairman was carried unanimously, a standing ovation being accorded Dr. Ridge, and the Conference terminated at 6.15 p.m.

Removal Expenses

The joint first report of negotiations between the Health Ministers and representatives of hospital medical and dental staff (*Supplement*, 27 May, p. 135) announced an extension of the existing removal expenses arrangements for medical and dental staff. A circular embodying these improvements has now been published (H.M.(67)39: Scotland, S.H.M. 39/1967), and the new arrangements began on 22 June.

The effect of the agreement is chiefly to extend the existing arrangements to include house-officers who transfer, on expiry of their appointments, to other posts in their existing grade, and medical assistants who move to another grade for approved training purposes. Consultants will also be included in certain approved cases.

The Minister will also consider reimbursement of removal expenses to doctors moving to a whole-time or maximum part-time consultant post when it is considered that there is a special need to attract candidates to a new post or where there has been or is expected to be difficulty in filling a vacancy in an existing post. Doctors taking up maximum part-time contracts will receive nine-elevenths of the sum payable to a doctor accepting a whole-time contract.

Doctors taking up appointments of up to six months' duration will be eligible for assistance with expenses, except the legal expenses of house purchase and sale, unless there is an established commitment to take a subsequent appointment in the same area.

Hospitality

A French doctor living in Paris would like his 18-year-old daughter to stay *au pair* with a British medical family from July for 6 months. In exchange the doctor would be pleased to receive a British girl aged about 18 to stay *au pair* with his family to help look after his other daughter aged 18 months, from September for 6 to 12 months.

A French doctor living in Rugles (Eure) would like his 22-year-old daughter to stay with a British medical family *au pair* for the month of August.

Would anyone who is interested please get in touch with Dr. R. A. Pallister, Medical Director, International Medical Advisory Bureau, B.M.A. House, Tavistock Square, London W.C.1.

British Medical Association

Supplementary Annual Report of Council, 1966-7

Since the publication of its Annual Report (*Supplement*, 6 May, p. 31) the Council has other matters which it wishes to report to the Representative Body.

Preliminary

Vice-President

289. It is with great pleasure that the Council recommends that Dr. John Oubridge Mercer, of Wellington, New Zealand, should be made a Vice-President of the Association.

Dr. Mercer has been Honorary Editor of the *New Zealand Medical Journal* for 28 years in addition to the many other outstanding services which he has rendered to the Association and to his colleagues in New Zealand.

> **Recommendation:** That John Oubridge Mercer, C.B.E., M.B., Ch.B., F.R.C.P. (London), F.R.A.C.P., M.A.C.P., be elected a Vice-President of the Association in recognition of his outstanding services to the Association and to the profession.

Private Practice

Fees for Part-time Services for Government Departments

(Continuation of Paragraph 145 of Annual Report)

290. The Council is now in a position to report that, following negotiations with the Treasury, agreement has been reached to increase the fees payable to general practitioners and consultants in respect of part-time services for Government departments by 10% on 1 July with retrospective effect to 1 October 1966.

Organization

Roll of Fellows

(Continuation of Paragraph 219)

291. The Council has approved the undermentioned for admission to the Roll of Fellows in 1967:

Division Making Nomination	*Nominee*
Nottingham Division	Vartan, Ronald Hepworth, M.B., Ch.B.

Other Association Activities

Ancillary Help

292. Council has noted the motion appearing in the Agenda for the forthcoming A.R.M. requesting an explanation why there is no reference in the Annual Report of Council to the following Resolution of the A.R.M. in 1966:

> 363. **Resolved:** That this Meeting wishes to draw attention of B.M.A. members to Medical Management Services Ltd.

During the debate on this item at the A.R.M. in 1966 reference was of course made to the services offered to members of the profession by Medical Management Services Ltd., and a full report of the debate appeared in the *Supplement* of the *B.M.J.* of 23 July 1966. To this extent the wishes of the A.R.M. have been fulfilled.

No further opportunity has been taken to draw the attention of the membership to M.M.S., because discussions with M.M.S. regarding the scope of the services offered by that body have not been completed.

The Council will therefore make a further statement as soon as it is in a position to do so.

Discount Trading

293. Independent Medical Services Ltd. has informed the Council that it has made an arrangement with a reputable discount trading organization which is prepared to offer its facilities to doctors. The Board of I.M.S. agreed, if Council so wished, that the scheme should be restricted to members of the Association, on the understanding that any established subscribers to I.M.S. who are not members should not be excluded. The Council has accepted this offer, and the scheme will be promoted by the Association as a benefit of membership. In order that this enterprise may be self-supporting it will be offered to members in return for a modest annual subscription to cover administrative costs.

The scheme will be administered by I.M.S., which will publish a catalogue containing a wide variety of branded goods on which the discount will, in the main, be of the order of 17–20%. A copy of the catalogue, with order forms, will be sent to each subscriber. Orders accompanied by remittances will be forwarded through the I.M.S. office, and the goods will be dispatched directly to the customer. The present range of goods is largely of personal, domestic, and household articles. Cars are available in certain areas of the country already, and arrangements are being developed elsewhere. Arrangements for trade-in value are being made. Furthermore, I.M.S. has on its own account arranged reduced rates for contract car hire for its members. In addition, the discount firm is prepared to deal in any type of goods for which there is a reasonable demand. The supply of professional equipment is under investigation.

The Council commends these arrangements to members.

RONALD GIBSON,
Chairman of Council.

Annual Representative Meeting 1967 Supplementary Agenda*

(Items received up to 26 June 1967)

Report of Agenda Committee

Order of Business

(To follow Item 10)

Amendment by TYNESIDE: That Item 557 be taken immediately after Item 270.

Amendment by EAST SUFFOLK: That Items 572 and 573 be taken immediately after Item 419.

Preliminary

Election of Vice-president

(To follow Item 15)

Motion by the Chairman of Council: That John Oubridge Mercer, C.B.E., M.B., Ch.B., F.R.C.P.(London), F.R.A.C.P., M.A.C.P., be elected a Vice-President of the Association in recognition of his outstanding services to the Association and to the profession.

Public Health

Fluoridation

(To follow Item 42)

Motion by KINGSTON-UPON-THAMES: That this Meeting notes with concern that many local authorities have not yet implemented the valuable preventive health measure of fluoridating the water supplies and urges all such authorities to review the situation immediately.

Free Milk in Schools

(To follow Item 46)

Amendment by WINCHESTER: That Item 46 be reworded as follows:

That this Meeting recommends that the issue of free milk to schoolchildren should be discontinued, except in the cases of medical necessity.

Amendment by TOWER HAMLETS: That the following be inserted immediately after the word "Meeting" in Item 46:

"being of the opinion that supplementary milk supplies are no longer necessary for the nutrition of the population of this country."

Medical Screening of School-crossing Patrol Staff

(To follow Item 50)

Motion by KINGSTON-UPON-THAMES: That this Meeting urges the appropriate authorities to institute medical screening (at least a check on visual capabilities) of school-crossing patrol staff.

Medical Ethics

Family Planning

(To follow Item 64)

Amendment by DARTFORD: That the following words be added immediately after the word

---

* The Agenda of the Annual Representative Meeting was printed in the *Supplement*, 10 June, p. 149.

"patient": "unless the treatment is carried out with the prior consent of the patient's own general practitioner."

General Medical Services

Remuneration and Terms and Conditions of Service

(To follow Item 70)

Amendment by TOWER HAMLETS: That Item 70 be reworded as follows:

That, with reference to paragraph 17 of the Annual Report of Council, the standard capitation fee is inadequate and should be raised to a realistic level.

Seniority Payments

(To follow Item 96)

Amendment by WINCHESTER: That Item 96 be reworded as follows:

That until 1972 family doctors over the age of 70 years providing full-time general medical services should continue to enjoy seniority payments.

Inducement Payments

(To follow Item 97)

Amendment by SOUTH SHIELDS: That Item 97 be amended to read:

That the criteria at present laid down for inducement payments are wrong and should include unattractive industrial areas where the doctor–patient ratio remains constantly high.

Night Visits
(To follow Item 106)

Amendment by CARDIFF: That the following sentence be added to the Motion: "This should be made to apply equally to subsequent visits, after the first, when the condition of the patient indicated that such further visits be made."

Organization

Constitution

Representative Body and Autonomous Bodies
(To follow Item 300)

Motion by SUNDERLAND: That paragraph 28 of the Report on the Constitution of the B.M.A. (Doc. A.R.M. 8) be amended by the addition of the following words: "provided such reference back is passed by at least a two-thirds majority of the Representative Body."

(Paragraph 28 reads as follows: "We therefore propose that the Representative Body should normally receive and approve reports on the work of the autonomous bodies, but when it wishes to exercise its right to disagree in any respect it would normally refer the matter back to the autonomous body before reaching a final decision.")

Second Tier—Regional Councils
(To follow Item 307)

Amendment by CLEVELAND AND MIDDLESBROUGH: That the words "a few" be substituted for "three."

Representative Body
(c) Proportional Representation
(To follow Item 321)

Amendment by CAMDEN: That the words "the seat becomes free and any member of that Division may be elected to fill it," be substituted for the words "the seat remains void."

(d) By-law 40 (Doc. A.R.M. 2, Appendix XIII)
(To follow Item 325)

Amendment by RUGBY: That the words "apply for" be substituted for the word "claim."

(f) Constituencies for Election of Representatives
(To follow Item 335)

Amendment by TEES-SIDE: That the proposals published in Appendix II of the revised Report on the Constitution of the B.M.A. be amended as follows:

"That constituency No. 45 should consist of three Divisions—viz., Cleveland and Middlesbrough, Hartlepools, and Stockton—returning three representatives, and constituency No. 46 should consist of the Darlington Division alone, returning one representative."

Council
(j) Elected Members of Council
(To follow Item 349)

Amendment by MID-GLAMORGAN: That the Motion be reworded as follows: "That the Council of the B.M.A. should always include a woman member of the B.M.A."

(To follow Item 360)

Amendment by NORTH GLAMORGAN AND BRECKNOCK: That, of the five members of Council proposed under the new constitution to be elected at the Annual Representative Meeting, three should be elected by the Representative Body as a whole and one each by the Scottish and Welsh Representatives respectively.

(m) Term of Office

(To follow Item 371)

Amendment by HALIFAX: That Item 371 be reworded as follows:

That with the aim of combining the benefits both of reasonable continuity and infusion of new ideas, the Council be requested to investigate the question of terms of office and eligibility for re-election as they affect officers, representatives, and committee members throughout the Association, centrally and locally, and to report the recommendations.

Private Practice

Fees for Services Outside the National Health Service

(To follow Item 390)

Amendment by NORTH MIDDLESEX: That the Motion 390 be reworded as follows:

"That comprehensive medical examinations and medical reports without examination required prior to the employment of individuals by local authorities, and reports required by local authorities in connexion with sickness of their employees, should in future be included in the Whitley agreement on remuneration of practitioners employed part-time in England and Wales, and fees should be at the same level as those recommended or agreed by the Association in other fields."

Statutory Fee for Notification of Diseases
(To follow Item 417)

Amendment by DERBY: That this Meeting feels that the statutory fee for notification of diseases to local sanitary authorities should be modified to take into account the diminution in the value of money which has taken place since 1889 when the present fee was fixed.

Therapeutic Abortion

(To follow Item 445)

Additions to List of Divisions after Item 445: Belfast, North Devon, Tower Hamlets.

Hospital and Consultant Services

Memorandum on the Current Problems of Hospital Medical Staff

(To follow Item 478)

Motion by BROMLEY: That this Meeting welcomes the first joint report of the negotiations with N.H.S. doctors and dentists which contains many important points. Even, however, on those points where agreement has been reached with the Ministry of Health, they regard it as doubtful whether these can be implemented in some areas as certainly they cannot be unless additional finance is provided for the hospitals.

Allocation of Distinction Awards

(To follow Item 501)

Amendment by DERBY: That this Meeting disapproves of distinction awards for consultants and considers that these awards should be replaced by seniority awards.

Domiciliary Consultations

(To follow Item 520)

Amendment by DERBY: That, in the case of whole-time consultants and S.H.M.O.s, all domiciliary consultations should be paid for.

Association Notices

Proposed Amalgamation of Redbridge and Stratford Divisions

Notice is hereby given by the Council to all concerned of the proposal to amalgamate the Redbridge Division and the Stratford Division to form a Redbridge and Stratford Division. Any member affected by this proposal and objecting thereto is requested to write to the Secretary of the Association by 29 July 1967.

DEREK STEVENSON,
Secretary.

Formation of the Hannover Branch

The Council hereby gives notice of the formation of a new Branch of the Association to be known as the Hannover Branch. The area of the new Branch is eastern Lower Saxony, West Germany.

DEREK STEVENSON,
Secretary.

Proceedings of Council

The Council of the Association had a short agenda for its last regular meeting of the session 1966–7. It approved a reorganization of the representative machinery in the B.M.A. for hospital junior medical staff. *It also* approved a Supplementary Annual Report (Supplement, 1 July, p. 13), in which, among other things, proposals for a discount trading service for B.M.A. members organized by Independent Medical Services Ltd. were commended to the Representative Body.

The Council of the Association held its last regular meeting of the session on 21 June. Dr. RONALD GIBSON was in the chair.

The CHAIRMAN expressed the Council's pleasure that Dr. J. C. Cameron, Chairman of the General Medical Services Committee, had been presented with the Claire Wand Award at the Annual Conference of Representatives of Local Medical Committees (*Supplement*, 24 June, p. 191).

Resolutions from Divisions

The Council considered resolutions from Divisions on various matters, including merit awards in general practice (Sutton Coldfield), security of tenure for general-practitioner clinical assistants (Sutton Coldfield), and fees for medical certificates for employees (South Staffordshire). The South Staffordshire resolution, which suggested that when an employer asked for a medical certificate about an employee the employer should pay not less than 10s. 6d. for it, was referred to the Private Practice and General Medical Services Committees for consideration.

The Coventry Division had requested that the Council "should press for the setting aside of the present proposed legislation on the medical termination of pregnancy until all relevant facts and beliefs had been advanced to, sifted, and considered by an independent body such as a Royal Commission."

The CHAIRMAN said that the Bill was now in the report stage and he believed the Government would give time in order to get it through Parliament. At this late stage nothing the Representative Body said would have much effect. The Council, in conjunction with the Royal College of Obstetricians and Gynaecologists, had been successful in getting a number of important amendments to the Bill, and there was only one outstanding amendment needed to bring it into line with the recommendations of the B.M.A.'s special committee (*B.M.J.*, 2 July 1966, p. 40). The Council would continue to press for this amendment, which concerned the qualifications of the doctors who performed the abortions.

A resolution from the Harrow and Hillingdon Division, that the Minister be asked for a radical simplification and reduction in the size of certificate forms used by general practitioners, in particular forms E.C. 73A, 73B, 73C, 74, and 81, was considered. Dr. CAMERON said that he hoped that these points and others would be settled shortly.

Another resolution from the Harrow and Hillingdon Division congratulated the Council on its efforts to back public health medical officers in improving their conditions of service.

Cervical Cytology Service

The Council considered a letter from the Chief Medical Officer, Ministry of Health, commenting on the Council's views on the progress towards establishing a nation-wide cervical cytology service. The Chief Medical Officer stated that the Ministry had established a committee on gynaecological cytology, under the chairmanship of Professor J. McClure Browne, which was considering certain of the points which had been raised by the B.M.A. The aim was to provide facilities for the examination of all women aged over 35 once in five years, and the service was now more than half way to that target, which would involve screening 2,600,000 women each year. The Chief Medical Officer said that the question of how best to extend the service to include those at greatest risk in the younger age groups was being considered.

The Ministry intended to ensure satisfactory liaison and co-ordination in all areas, and it welcomed the Council's support in this aim. The Ministry also gave full support to the Council's views on the provision of training facilities for taking smears, but pointed out that this training must be provided by gynaecologists who were, in many areas, hard pressed.

The CHAIRMAN said he thought that this reply from the Ministry was very satisfactory. Dr. CAMERON said that the G.M.S. Committee would continue to press for the age limit to be abolished. Clinics had never observed this rule.

Discount Trading

Dr. IVOR JONES (Chairman, Committee of Management, Independent Medical Services Ltd.) reported on Independent Medical Services's offer to provide a discount trading service to B.M.A. members. The legal and administrative aspects of providing discount trading facilities had been discussed, and the advantages in providing this service had been measured against its practicability and the advisability of such activities on the part of a professional association.

An *ad hoc* B.M.A. committee had examined the proposals and its recommendations to the Council were that the offer of the I.M.S. discount trading service should be accepted; that it should be restricted to B.M.A. members; and that existing subscribers to I.M.S. who were not members of the B.M.A. should not be excluded. There would be no entrance fee. The B.M.A. would promote the service and I.M.S. would run it. The B.M.A. would have no legal or financial obligations. The question of the advisability of a membership card and number would be remitted to the Organization Committee for consideration. The promotion of the scheme would also be the responsibility of the Organization Committee.

Dr. Jones said that the service could be offered to all doctors on payment of an annual subscription which would probably be about two guineas and would cover administrative and printing costs. Alternatively there could be a concessional level of subscription to B.M.A. members or the scheme could be limited to B.M.A. members only. The Committee of Management of I.M.S. would accept the B.M.A.'s decision on this point. The Association would be involved only in promoting the scheme, at its discretion, as a service to members.

Unsatisfactory Scheme

Dr. A. M. **Rankin** thought it was an unsatisfactory scheme. He objected to it, chiefly as a shareholder in I.M.S., on three counts. Firstly, when I.M.S. was formed Dr. Jones had asked general practitioners for financial support, and 6,000 doctors had subscribed. Dr. Jones was now inviting doctors to put their hands in their pockets again to give benefits to those who had not supported I.M.S. in the first place. Secondly, Dr. Rankin thought there was a patronizing tone in the statement that the service should be restricted to members of the B.M.A. but existing subscribers to I.M.S. who were not members of B.M.A. should not be excluded. It looked as though these doctors were being given something they were not entitled to. Thirdly, doctors who joined I.M.S. in future were not going to get discount unless they were members of the Association. The scheme ought to go back to I.M.S. to be looked at again, said Dr. Rankin.

Dr. **Jones** said that Dr. Rankin's points were contradictory, since he had started by suggesting that the scheme should be limited to people who contributed to I.M.S. in the first place. A different rate of subscription for those who had contributed to I.M.S. to those who had not had been considered, but the original appeal for funds to I.M.S. had been restricted to general practitioners, and I.M.S. wished to make this scheme available to all doctors. The enthusiasm for a scheme of this kind was greatest among hospital junior doctors, and it would have been contrary to Council's wishes to make the cost to these doctors any higher.

After discussion with the officers of the Association, it had been agreed that the solution lay not in using existing I.M.S. funds to administer the scheme but to found it as a service for all doctors financed by a uniform subscription for all doctors. There might be a handful who were not members of the B.M.A. but who had subscribed as general practitioners to the original I.M.S. fund, and they would feel harshly dealt with if they were excluded from the scheme. It had therefore been decided that an exception should be made in their cases.

Dr. G. R. **Outwin** said that once again the Council was being asked to associate the B.M.A. with an I.M.S activity. Those doctors who subscribed originally might say that their money was being used for a purpose for which it was not intended, and once again the B.M.A. would be linked with criticism of I.M.S. The I.M.S. was a "dead duck," and the B.M.A. should consider what the original purpose of I.M.S. was, though the B.M.A. was committed to supporting I.M.S.

Dr. J. S. **Happel** said that, since the B.M.A. itself was not allowed under its articles to organize a discount scheme, Dr. Jones was to be congratulated on providing one.

Dr. **Joan Chappell** asked when the matter would be reported to Divisions and B.M.A. members, so that they could make their views known.

Encouraging Membership

Dr. J. S. **Noble** said that the Organization Committee had been given powers to seek ways of increasing B.M.A. membership. One of the things considered had been a discount service. Every junior doctor to whom he had spoken had been impressed with the idea. The I.M.S. had solved the constitutional difficulties, and this should satisfy those who objected to a professional association supporting such a scheme. Members could be made aware of the scheme through a supplementary annual report of Council before the Representative Body.

Dr. J. S. **Ross** said it was clear that under the Companies Act the B.M.A. could not take part in discount trading, since it brought gain to individual members of the Association. For this reason, said Dr. Ross, he felt uncomfortable that I.M.S., with its close association with the B.M.A., should provide a discount trading service.

Dr. **Jones** replied that the Association's solicitor had made it quite clear that there was no impropriety in the Association making an arrangement with I.M.S. which was analogous to the arrangements which the Association made in such matters as insurance. The original appeal for I.M.S. had been drawn up by the Association's solicitor, and the purposes for which I.M.S. could operate were specifically laid down in its Articles of Association. The present proposal was for financing a discount service by subscription, not for utilizing money which had been subscribed for another purpose. That was the main reason for financing the scheme by a special subscription. I.M.S. was certainly not a "dead duck." An increasing number of doctors were leaving the National Health Service and beginning to operate the scheme. Further, arrangements were far advanced for extending the scheme to hospital and specialist treatment.

Dr. A. V. **Russell** was in favour of the scheme, but Dr. C. P. **Wallace** thought that if it was improper for the B.M.A. to arrange it it was also improper for I.M.S. to do so.

Dr. A. **Skene** said that members of Council would be reassured that "the fiddle is legal," but he thought there was a matter of principle involved. There were many organizations which offered cut prices to their members, and any doctor could join one of those organizations if he wished. He was not sure that the Association would benefit by joining the "cut price racket."

Dr. G. R. **Smith** said it was important that I.M.S. should not become known as a discount trading company, and he was sure Dr. Jones did not intend that. I.M.S. was not a dead duck, and it was up to the Council to see that it did not become so. If the I.M.S. failed through lack of support then the profession failed. I.M.S. stood for independence and the ability and willingness of the profession to state its case. Discount trading could give a boost to I.M.S. to further its original aims.

The report on the discount scheme and the recommendations were accepted by the Council, and it was agreed that it should be reported to the Representative Body in a supplementary annual report (*Supplement,* 1 July, p. 13).

Medical Charities Year

Dr. R. **Cove-Smith**, Chairman of the Charities Committee, asked the Council to consider his committee's recommendation that "the proposal to launch a medical charities year in 1967 be accepted on the understanding that a professional organization be invited to conduct a preliminary survey at a cost of about £750, this cost to be met in the first place from the charities' own funds." The Finance Committee had taken exception to a medical charities year on the grounds that the costs of the appeal, estimated to be between 7 and 10% of the sum raised, appeared to be out of proportion to the target and scope of the appeal. The Charities Committee had envisaged a target of at least £50,000 gross, including covenanted subscriptions for seven years.

Dr. Cove-Smith said that two professional fund-raising organizations had now been consulted, and the conclusions drawn from the discussions were that a target of £100,000 gross over seven years was, if anything, too modest. The overall costs of the campaign should not exceed 10% and were likely to be less. A preliminary survey should be carried out by a professional firm to assess the viability of the proposal and the best methods of approach.

After discussion the Council decided that it would not reject the recommendation, but it asked the Charities Committee first, in the light of further information available, to reconsider whether it could not use its own resources to organize an appeal.

Mental Health

Dr. M. Sorsby attended the meeting by invitation to present a memorandum prepared by the Committee on the Mental Health Act (1959), of which he was chairman. The memorandum set out the committee's proposals for improving the mental health services, and it referred mainly to the services in the Greater London area.

Dr. **Sorsby** said that ten years ago representations had been made to the Ministry of Health about the mental health services, and the Ministry had indicated that in ten years everything would be all right. But, said Dr. Sorsby, after ten years everything was far from being all right. He asked that the recommendations in the memorandum should be put to the Ministry.

Dr. J. J. A. **Reid** moved the reference back of the memorandum. He agreed that there was cause for complaint, but the recommendations in their existing form must not be sent to the Ministry. The whole subject should be reconsidered on a broader basis and recommendations covering the whole country drawn up. If there was a special problem in London, as appeared from the memorandum, a special subcommittee should consider them and separate proposals should be sent to the Ministry.

Dr. **Wallace** agreed with Dr. Reid. The Council could not support a hotch-potch of comments, inadequate statistics, and opinions, though some of the conclusions and much of the information contained in the memorandum were most valuable.

Dr. H. L. LEAMING thought the Council could not approve the recommendations, but he suggested the memorandum should be referred to the G.M.S., the C.C. and S., and Public Health Committees for comments. The subject matter of the report was causing much concern in the Health Service, and action to improve the mental health services was urgently needed.

Dr. CATHERINE GRAY said that the report should be referred back, and it should be related to the country as a whole. If it was going to the Ministry it was no use dealing with one area only.

Dr. F. STEEL said that many societies were concerned with the problem, and he wondered if there had been any liaison.

Valuable Memorandum

Dr. CAMERON said that the impression might be gained from Dr. Reid's remarks that the memorandum was without value and that Dr. Sorsby and his committee had failed, but that was not so. Dr. Sorsby had pressed continously since 1960 to improve the arrangements under the Mental Health Act in the Greater London area, where all the mental hospitals were in Surrey and most of them were in one regional hospital board area. Dr. Cameron said doctors would have preferred other regional boards to take some of the hospitals over, but that had not been possible. He thought there should be a broader-based committee, and this was not the time for referring the matter to the other committees.

Dr. SORSBY, replying to the debate, said he would agree to consider the subject again on a wider basis. There were two problems, that of the London area and the general one of how to achieve improvements in the administration of the Act.

The Council decided to refer the memorandum back to the committee.

General Medical Services

Dr. CAMERON, reporting on the work of the General Medical Services Committee, said that it had been invited to consider the questionary issued by the Central Health Services Council's Committee on the Functions of the District General Hospital. General practitioners were not broadly represented on this committee, said Dr. Cameron, but Dr. Michael Wilson, a young doctor, had agreed to serve.

Because of its importance to general practitioners, a copy of the questionary had been sent to all local medical committees in England and Wales inviting them to submit their views to the G.M.S. Committee, and the Committee recommended that the questionary should now be sent to B.M.A. Divisions and Branches for their comment.

The Council accepted the recommendation.

Reporting on discussions with the Ministry on the question of payment by salary, Dr. Cameron said that it was important to differentiate between a salaried service and a salaried method of payment. No progress had been made on proposals put forward by the Minister of Health, which the G.M.S. Committee had found unacceptable. The Committee had decided to ask to see the Minister again, and its representatives would be accompanied by those of general practitioners in favour of a salaried method of payment. However, they had been overtaken by events, said Dr. Cameron, because the Annual Conference of Representatives of Local Medical Committees (*Supplement*, 1 July, p. 2) had carried a motion from Inner London that there should be no further discussions on the salaried method of payment until the Minister had agreed that payment by item of service was also made available for those who wished it.

Fees

The Council considered proposed increases in fees for part-time medical services for Government departments. Dr. IVOR JONES, Chairman of the Private Practice Committee, reported on the negotiations which had taken place with the Treasury. The Treasury had attached certain conditions to its agreement to increase the fees, and the Council decided that further clarification should be sought. Subject to that being satisfactory, it was agreed that the increase should be accepted.

Hospital Junior Staff

Mr. H. H. LANGSTON presented the report of the Central Consultants and Specialists Committee. The report was concerned solely with proposals for the reorganization of the Hospital Junior Staffs Group Council and the regional groups.

Mr. Langston said that the recommendations meant that the Association would provide a complete and comprehensive service for hospital junior doctors, and those who said that they were not adequately represented would no longer have substance in their allegations. If regional groups met regularly and worked efficiently and there was good communication with the centre many of the difficulties and misunderstandings which had occurred in the past would be overcome.

Mr. G. E. MOLONEY said he hoped there would be adequate representation of senior consultants' views.

In reply to Dr. J. S. NOBLE, Mr. LANGSTON said that the problem of communications with hospital junior staff was under consideration.

The recommendations were approved.

Other Reports

The Council also received reports from the Film Committee, the Finance Committee, the Journal Committee, the Scottish Council, and the Joint Committee of the B.M.A. and British Veterinary Association.

When presenting the report of the Journal Committee Dr. HAMILTON said that he was not seeking re-election to the Committee, and this would be the last time he would be presenting its report to the Council.

The CHAIRMAN paid a warm tribute to the long and valuable services of Dr. J. G. M. Hamilton to the Council and to the Journal Committee, of which he had been chairman since 1954.

Retiring Members

The CHAIRMAN thanked retiring members of the Council for their services. Those who made valedictory speeches were Dr. S. NOY SCOTT, who had been a member of the Council for 17 years, Dr. J. G. M. HAMILTON, Dr. H. C. W. BAKER, and Dr. G. R. SMITH.

More Consultant Posts

The Minister of Health has asked hospital boards in England and Wales to advertise over the next few months additional consultant posts and to readvertise unfilled posts. The consultant posts to be advertised are within those requested in the reviews of hospital medical staffing that resulted in the Platt report. The additional posts will be advertised in selected regions and mainly in general medicine, general surgery, traumatic and orthopaedic surgery, anaesthetics, and mental illness. The Minister has stated (*Supplement*, 27 May, p. 135) that doctors with satisfactory training will not be excluded from consideration for appointment to these posts on the ground that they have spent little or no time as senior registrars. Doctors in the medical assistant grade will also be eligible to apply for these posts.

The Ministry has stated that there is no intention of lowering the standard of entry to the consultant grade, but merely to allow every candidate to be judged by the Advisory Appointments Committee on the length and quality of his training and experience and on his other attributes without being debarred by any rigid requirement about length of service in one particular grade.

The negotiating team representing all National Health Service hospital doctors had represented (*Supplement*, 13 May, p. 93) to the Health Ministers that immediate steps should be taken to attain the establishment of consultants recommended by the Platt reviews, and that there were many senior registrars, including some who had not yet completed the normal tenure of their posts, and also long service registrars who had the necessary experience to fill consultant vacancies immediately. The profession's representatives stated that there were a number of well-trained registrars held up in the grade by the bottleneck in promotion higher up.

Discussions are taking place with the Ministry on the problem of time-expired registrars and senior registrars who have been only a short time in their existing grade but were a long time in the registrar grade.

General Medical Services Committee

Dr. J. C. Cameron was unanimously re-elected chairman of the G.M.S. Committee at its first meeting of the new session. The negotiating team for general practitioners was appointed with powers for the chairman to co-opt others when he wished. Members were appointed to various working groups on special subjects.

The Ministry of Health is to be asked whether, as one of its auditors seemed to think, the help that must be employed in a group practice before its members qualify for additional payment must be a full-time helper. The Minister of Health is to be asked to consider whether the terms of the N.H.S. Acts could prevent nurses, midwives, and health visitors from working in doctors' practice premises.

According to the Ministry of Health the betterment levy on land development value under the Land Commission Act, 1967, would not normally be payable by a doctor building a surgery or adapting or improving premises for use as a surgery.

The General Medical Services Committee held its first meeting of the session 1967–8 on 22 June. Dr. J. C. CAMERON was unanimously re-elected Chairman of the Committee, and was given a standing ovation.

The CHAIRMAN welcomed the new members of the Committee.

Negotiating Team and Working Groups

The Committee proceeded to appoint the negotiating team and working groups.

Dr. CAMERON said that the amount of work falling on the Chairman was so great that it was essential some of it should be delegated. He expressed his appreciation to all members of the Committee who had served on the working groups.

The negotiating team had been appointed by the Committee in the crisis after the fifth report of the Review Body in February 1965. It had been added to since, and the help of rural practitioners and of other members of the G.M.S. Committee had been called on from time to time. Dr. E. V. Kuenssberg had now given up his membership of the team.

Dr. Cameron said that the negotiations had reached a stage where it was not necessary for the full team of negotiators to go to the Ministry each time. It was essential, he said, to have a nucleus of two or three members who would attend most of the meetings. That would ensure continuity. But he would like to have the authority of the Committee to call on members with a knowledge of and interest in particular matters under discussion to assist the negotiators.

Dr. Cameron asked for the Committee's views on the policy to be adopted for the next session.

Dr. I. M. JONES thought there was some advantage in having as a nucleus those who had acquired valuable experience in negotiating in recent months. Apart from that, he thought the Chairman should be free to add to his team as he wished for specific occasions.

Dr. H. N. ROSE took the view that negotiations would virtually never be completed, and that a negotiating team would always be needed. There was much sound sense in what had been suggested, but he thought that it would be valuable to have a younger doctor included in the team.

Informing the Periphery

Dr. R. A. KEABLE-ELLIOTT said that it was important for the periphery to know that doctors from outside the negotiating team were called in on numerous occasions to assist. There was a feeling in some parts of the periphery that the team was a small group which did all the work and which might not always be the best suited to do it. He did not agree with this view, but if the members on the periphery knew that the team called on members of the G.M.S. Committee as well as other doctors outside to assist it would strengthen the team's position. Dr. C. J. SWANSON agreed with a suggestion that specialists in particular subjects should occasionally attend, and urged that the services of the Chairman of the G.M.S. Committee (Scotland) be used.

Dr. R. J. T. GARDINER said that under the new Charter it seemed there would be little latitude for varying the regulations in Northern Ireland, such as there had been in the past. The decisions taken in London would have greater repercussions than formerly. Though Northern Ireland would not ask to be included in the negotiating team, nevertheless it was hoped that the Chairman of the Northern Ireland G.M.S. Committee would be invited to attend as an observer or to contribute to the discussions on the matters affecting Northern Ireland. Dr. H. S. HOWIE WOOD thought that leaving it to the Chairman's discretion had worked well, and the Committee should leave it to the Chairman to carry on.

Dr. CAMERON said he was anxious to dispel any feeling there might be that there was anything like a caucus or a cabal.

Dr. A. SPEAKMAN said he had often marvelled at the stamina of the negotiators. He strongly urged Dr. Cameron to take other negotiators with him, so that in the event of illness or inability to attend the thread was not broken. Dr. W. W. FULTON said he agreed with Dr. Swanson that the Chairman of the G.M.S. Committee (Scotland) should be a member of the team.

Carte Blanche

Dr. G. CORMACK favoured the reappointment of the basic team, and suggested that the Chairman be given carte blanche to co-opt or appoint to the team whoever he thought best qualified to take part in the matters under discussion. Dr. Cormack accordingly moved that.

Dr. HOWIE WOOD seconded the motion.

Dr. T. K. COOKE urged the need for representation of rural practitioners' interests.

Dr. A. ELLIOTT said that appointing a negotiating team had been a new departure. The G.M.S. Committee had always been jealous of the fact that it was an executive committee. The Chairman had indicated earlier the strain that negotiating involved, and the heavy burden that fell on a few. Various plans had been put forward in the past for this or that committee to vet things, and when the negotiating team was set up some members of the G.M.S. Committee had been rather worried, thinking that the profession was putting its future into the hands of only a few people. As Dr. Keable-Elliott had pointed out, there were still certain suspicions in the periphery.

The Chairman had mentioned that the position had now changed, said Dr. Elliott. However, he was worried that doctors in the periphery might still feel uncertainty. The Chairman might also be put in an invidious position if he was given carte blanche to choose whom he liked to join the team. Dr. Elliott said that it would be useful if the names of those taking part in the discussions could be made known to the profession. He supported Dr. Cormack's motion, but wondered whether there might be a case for having a panel of doctors elected by the G.M.S. Committee from which the Chairman could nominate. That would strengthen his hand and prevent him from being put in an invidious position if any criticisms were made.

Dr. R. W. RAE said that the negotiating team was appointed for a special purpose when decisions had to be made quickly. There was a tendency to forget that it was the G.M.S. Committee that negotiated and was responsible for the results of negotiation, and that it was the Committee's responsibility to select whom it wanted to undertake the negotiations. It would be wise, he thought, to get back to the basic principle that the G.M.S. Committee was the responsible body. The important thing was to ensure that the right people undertook the negotiations.

Dr. J. S. HAPPEL supported Dr. Cooke, and recalled that at the Conference of Local Medical Committees the motions concerning rural practice had been dealt with in such a way that the movers of the motions were very angry. There was undoubtedly a feeling that the rural practitioners had not done well out of the negotiations, and that their problems had received scant consideration.

Scottish Representation

Dr. J. E. MILLER said that Dr. Kuenssberg had been appointed to the negotiating team when he was Chairman of the G.M.S. Committee (Scotland), and he considered that the continuity of this representation should be maintained. This was not because of any particular vested interests, said Dr. Miller, but because of the differences in the N.H.S. Acts as they applied in England and Wales and in Scotland. It was also of value to the Scottish negotiators to have the background knowledge when negotiating with the Scottish Home and Health Department. On occasions when there had been, for example, a difference of opinion between the Scottish G.M.S. Committee and the Scottish Home and Health Department, and Dr. Kuenssberg had been unable to be present at the meeting, there had been difficulties.

Dr. Miller therefore suggested that Dr. Cormack's motion and Dr. Swanson's suggestion should be married—namely, that there should be a basic team as before, merely replacing Dr. Kuenssberg by the present Chairman of the G.M.S. Committee (Scotland), and giving the Chairman of the negotiating team carte blanche to call for additional help from any member of the G.M.S. Committee when he considered it necessary.

Dr. Cormack said he would be happy to amend his motion in that way.

Dr. Cameron said the discussion had been useful. He was anxious not only to preserve continuity but also to make it clear that in the new negotiations the help of rural practitioners would be needed. The interests of Northern Ireland would also need to be covered. The strength lay in the working groups which studied various subjects in detail.

The motion, as amended, was carried.

The Committee appointed the following members to the Negotiating Committee: Drs. J. C. Cameron, I. M. Jones, A. M. Maiden, R. B. L. Ridge, and A. A. Clark (Chairman of the G.M.S. Committee, Scotland), with Dr. J. E. Miller as Dr. Clark's deputy.

Working Groups

The Committee then appointed the following members to the working groups for 1967–8.

Disciplinary Machinery Working Group: J. C. Cameron, E. Colin-Russ, B. Holden, I. M. Jones, N. S. Malimson, J. E. Miller, R. B. L. Ridge, C. J. Wells, the Secretary of the Medical Defence Union, the Secretary of the Medical Protection Society, the Secretary of the Medical and Dental Defence Union of Scotland, and the Association's solicitor.

Dispensing Working Group: G. Cormack, J. S. Happel, H. B. Muir, A. J. Rowe, G. Scott, and M. A. Weller.

European Economic Community Working Group: J. C. Cameron, G. Cormack, R. J. T. Gardiner, B. Holden, I. M. Jones, J. E. Miller, A. J. Rowe, and C. J. Wells.

Hospital Working Group: J. C. Cameron, W. W. Fulton, B. Holden, R. A. Keable-Elliott, R. B. L. Ridge, C. J. Wells, M. A. Wilson, and H. S. Howie Wood.

Maternity Services Working Group: J. C. Cameron, H. J. Eastes, A. Elliott, J. McGlone, R. B. L. Ridge, Joan K. Sutherland, and T. K. Cooke.

Planning Working Group: D. C. Bowie, J. C. Cameron, A. A. Clark, G. Cormack, A. Elliott, R. J. T. Gardiner, J. S. Happel, B. Holden, I. M. Jones, A. M. Maiden, J. E. Miller, R. B. L. Ridge, C. J. Wells, and M. A. Wilson.

Working Group on General Practice, Finance Corporation, and Practice Premises: W. E. Bowden, J. C. Cameron, E. Colin-Russ, G. Cormack, A. Elliott, W. W. Fulton, R. J. T. Gardiner, J. S. Happel, D. F. Heath, G. T. E. Jenkins, J. R. Preston, R. B. L. Ridge, and the Association's solicitor.

Health Centre Subgroup: J. C. Cameron, A. Elliott, W. W. Fulton, G. T. E. Jenkins, J. R. Preston, R. B. L. Ridge, and the Association's solicitor.

Terms of Service Working Group: E. Colin-Russ, W. Keith Davidson, R. A. Keable-Elliott, N. S. Malimson, A. N. Mathias, R. B. L. Ridge, A. Speakman, C. J. Wells, and the Association's solicitor.

Mental Health

Dr. Max Sorsby (Chairman of the Committee on the Mental Health Act, 1959) told the Committee that at the Council meeting on 21 June (see page 15) it had been resolved to refer the Committee's memorandum and its recommendations back. The Council thought the report was slanted towards the Metropolitan area and did not give a true picture of the whole country. Dr. Sorsby said that the memorandum had contained a great deal of information. The slant towards London was because he knew the Metropolitan area best. The Council had asked that a broader-based committee should present a further report setting out the national problems and the metropolitan difficulties separately. Certainly the troubles in London were great and something must be done to ease the position, said Dr. Sorsby, particularly on the north side of the river. The problem might be taken direct to the Minister of Health before the final report was produced.

Dr. Happel said that clearly there was a special problem in the Metropolitan area, but the report as presented to the Council bore no relation to the conditions in, for example, Hampshire. A much broader-based committee was needed.

Dr. Cameron said that Dr. Sorsby had rendered great service in the mental health field. The Mental Health Act had been in existence for about 10 years and most general practitioners would agree that the time had now come to look at some of its aspects, so the Council's decision to have a wider-based committee was a welcome one.

Ophthalmic Medical Practitioners

Dr. Sorsby referred to a communication from the Ophthalmic Group Committee after the G.M.S. Committee had considered the criteria for admission to the central professional list of ophthalmic medical practitioners. The G.M.S. Committee had suggested discussions within the profession before a formal reply was sent to the Chief Medical Officer, Ministry of Health, who had put forward suggestions on this matter.

Dr. Sorsby said he was not happy with the suggestion in the communication that general practitioners should appoint two representatives to take part in the discussions. That meant that the G.M.S. Committee representatives would be in a minority of two to six. (The other representatives would be two from the Ophthalmic Group Commitee, two from the Ophthalmic Qualifications Committee, and two from the Faculty of Ophthalmologists.) Dr. Sorsby thought this representation was grossly unfair, particularly in view of the comment at the end of the communication: "We are of the opinion that there is no real need to change the criteria as presently defined by regulations." He accordingly urged that the Committee should press for equal representation.

Dr. Malimson and Dr. Cormack supported Dr. Sorsby's request for equal representation.

The Committee agreed to take action to this effect.

Fees for Road Accidents

Dr. Fulton said that the G.M.S. Committee (Scotland) had suggested that representations should be made to the Private Practice Committee for a supplementary fee of 29s. 6d. for attendance at road accidents. The existing fee of 12s. 6d. was unrealistic. The item-of-service payment would be in addition to the fee, making a total of two guineas, and it would be in lieu of an emergency service fee. The fee would be payable by the executive council.

Dr. I. M. Jones said that the Ministry had agreed to discuss the amount of the fee.

The matter was referred to the Private Practice Committee.

Immunizations and Vaccinations

Dr. B. L. Alexander commented on the Ministry of Health's circular to local health authorities which stated that if records of vaccinations or immunizations not undertaken in pursuance of public policy were wanted ad hoc arrangements should be made with general practitioners through the local medical committee; and a fee of 5s. offered for each record. The Inner London Local Medical Committee, which had brought the matter to the G.M.S. Committee's attention, considered that a fee of at least 7s. 6d. should be negotiated.

The Committee agreed that a fee of 7s. 6d. was appropriate.

The Committee considered a letter from the Essex Local Medical Committee about the changed procedure for notifying vaccinations and immunizations since the introduction of the claim forms for item-of-service payments. The letter drew attention to the fact that, since the notifications were no longer sent direct to the local health authority, doctors might no longer receive reminders of the need for repeat or booster doses.

Dr. W. Hedgcock, Secretary of the Committee, reported that it was proposed that a fee of only 5s. should be paid in the case of patients who were vaccinated against smallpox and who went abroad immediately without giving the doctor an opportunity to check whether the vaccination was successful. A fee of 7s. 6d. implied that the doctor saw the patient twice, once to vaccinate and the second time to check.

The Committee rejected the proposal, and decided to refer the matter to the Public Health Committee.

Information to Hospitals

It was reported that a letter from the Ministry of Health had been received, in answer to an inquiry from the Committee, stating that a modification of the hospital letter H.M.R. 300 (informing a general practitioner when his patient was to be admitted) had been agreed in principle which would enable general practitioners to provide hospitals with information about treatment and drugs given to patients before their admission. The advisory committee on hospital medical records had also considered the problem.

Dr. C. J. WELLS said it would be a pity to let pass an opportunity for extending the use of modified Form H.M.R. 300. He said he used a treatment card, which he gave to patients under long-term treatment to carry with them. It was useful when they were on holiday, or were involved in an accident. Dr. Wells thought that Form H.M.R. 300 might be modified to be used for that purpose.

The Committee agreed to give the matter further consideration when the draft revised forms were available.

Employment of Ancillary Staff

A letter from Rotherham Local Medical Committee was before the Committee stating that, at the annual audit of the accounts of the Rotherham Executive Council, the Ministry of Health's auditors had questioned the clerk of the council on the additions for group practice which had been made to the doctors' basic practice allowance in several cases, in according with paragraph 11 of the "Statement of Fees and Allowances" (the "Red Book"). The auditor had particularly referred to proviso (iv) of paragraph 11, which stated that "a group must employ help to the extent of at least one person who can provide services of the secretarial, nursing-receptionist, or medico-social worker type." The sentence after that stated that "executive councils will exercise discretion in interpreting the terms of this definition."

The Rotherham Local Medical Committee wrote that it understood that the Ministry's auditor was trying to rule that under proviso (iv) the ancillary help must be full-time—i.e., for at least 38 hours a week. The auditor also disclosed that while payment for the ancillary services of a doctor's wife was not recognized for reimbursement such services could be recognized for the purpose of paragraph 11 (iv) for the group practice addition. The Rotherham Local Medical Committee submitted that the auditors were unreasonable, particularly in contending that a group practice must employ at least one full-time ancillary assistant for at least 38 hours. That conflicted with what executive councils and local medical committees believed to be the case, and it seemed to Rotherham that the auditor was seeking to impose his discretion in place of that given to executive councils.

Dr. WELLS said that the letter contained some disturbing information. He suggested that the matter should be taken up at the next meeting with the Minister, and the Committee agreed.

Attachments in General Practice

It was reported that the solicitor's advice had been taken on a letter from the Essex Local Medical Committee which the G.M.S. Committee had considered at its last meeting (*Supplement*, 3 June, p. 139).

The letter had stated that the attachment of nurses, midwives, and health visitors to general practitioners had been working well in Essex, but suggestions had now been made that local health authority staff might not carry out injections or other treatment in doctors' surgeries. Sections 23, 24, and 25 of the N.H.S. Act, 1946, dealing respectively with midwives, health visitors, and home nurses, specifically provided for the attendance, visiting, and nursing of people in their own homes. The Essex Local Medical Committee had thought that it would be unfortunate if strict regard to the statutory provision should prevent local health authority staff helping general practitioners in their surgeries. The Local Medical Committee suggested that the Minister should be asked to amend the statutory provisions if necessary.

The solicitor had advised that there was "no cause for concern." Section 22 of the National Health Service (Amendment) Act, 1949, enabled midwives "to render all services reasonably necessary for the proper care of the women upon whom they so attend." Section 24 of the National Health Service Act, 1946, imposed a duty on a local health authority to provide health visitors to visit persons in their homes for the purpose of giving advice. This was an obligation on local health authorities, but there was nothing in the obligation to prevent the authority from taking additional measures. The position of home nurses was dealt with in section 25 of the 1946 Act, and was similar to that of health visitors.

Dr. ROSE said that in some parts of Essex the area medical officer had suggested that it was illegal under the Act for the district nurse to perform services at the doctor's surgery. The Ministry must be convinced that that was not so.

Dr. J. R. PRESTON said that a number of local authority health committees were having difficulties in the matter, though they wished to co-operate with the general practitioner and the hospital services. The difficulty was in the words in the Act "in their homes." He hoped the matter would be cleared up with the Minister of Health.

Some Questions

Dr. G. T. E. JENKINS said that Middlesex Local Medical Committee was concerned over a broader issue. There was doubt about what duties district nurses would be allowed to carry out for general practitioners. Would they merely carry out their existing duties or would they be allowed to do more? Would co-operation between health visitors and general practitioners lead to clashes of views between the local authority and the individual doctor? Would ancillary workers be allowed to disclose clinical information they might have gained, through co-operation with general practitioners, in social case conferences held by the local authority? To whom would clerical staff be finally responsible? They would be employed by the local authority, but would the general practitioner be in a position to hire and to fire them? Who would take the responsibility for a breach of confidence or a breach of the agreed duties?

Dr. A. ELLIOTT said that these matters had been discussed before, and it had been agreed that it was undesirable to lay down regulations. He hoped that the Ministry would overcome any difficulties where they existed.

Dr. K. DAVIDSON said that there was concern over this problem in Scotland. If the Ministry was asked to tighten the regulations it might prevent advance rather than help to clear up the position. It would be better to leave it for the moment. Dr. MALIMSON said that in most cases district nurses visited patients and worked in the doctors' surgeries, and there were no difficulties. The Act did not say that they should work only in patients' homes. Dr. A. J. ROWE said that inoculations were not normally part of a district nurse's work. Who was legally responsible for any act or omission of a nurse who did something which was not part of her normal activities? Dr. E. TOWNSEND suggested that the Ministry should be asked to clarify the matter and to instruct local health authorities on how they should interpret the regulations.

The Committee agreed to approach the Minister to ask for clarification.

Restrictive Professional Practices

The Committee received a report from the CHAIRMAN that the B.M.A. had agreed to give evidence to the Monopolies Commission in its inquiry into restrictive practices affecting professional services, and that the G.M.S. Committee and other committees of the Association had been asked to consider this. However, the CHAIRMAN said the Monopolies Commission could not report on practices expressly authorized under any enactment or Royal Charter, and he thought a large field of general practitioners' activities were outside the scope of the inquiry. But he suggested that legal advice should be sought in case there were any aspects of the matter with which the G.M.S. Committee should concern itself.

The Committee agreed that legal advice should be sought.

Land Commission Act

The Committee had informed the Ministry of Health that, in the Committee's view, the betterment levy incorporated in the Land Commission Act, 1967, would halt improvements in surgery accommodation.

In a letter in reply, which was before the meeting, the Ministry had stated that there seemed to be some misconception about the levy. A leaflet had been published by the Ministry of Housing and Local Government entitled "Betterment Levy" [an explanatory memorandum on Part III of the Land Commission Act, 1967. H.M. Stationery Office, price 4s. 6d.] which explained the meaning of the levy. Broadly speaking the Act imposed the levy only when the owner of land realized its development value as distinct from its current-use value. Once a development value levy had been paid the levy was not charged again. When a doctor bought land to build a surgery the vendor, who ordinarily realized the development value, would pay the levy. There would normally be no question of a subsequent charge on the doctor, provided building of the surgery started within two years of buying the land. Even if building started more than two years later any liability to levy was likely to be small, since the price the doctor paid for the land would be the starting price in calculating the development value.

A doctor who bought a house or similar property for use as a surgery would not ordinarily have to pay the betterment levy, said the Ministry, even though some adaptation of the premises was needed. There would be no question of a levy when surgery premises already owned were improved, unless the floor area was increased by more than 10% or 1,000 square feet, whichever was the greater. If these limits were exceeded a levy might be payable. In such a case the amount of a loan obtainable from the General Practice Finance Corporation would include the amount of the betterment levy.

Vocational Training

Dr. D. C. Bowie presented an interim report of the Advisory Committee on Vocational Training and Continuing Education for General Practice, of which he was chairman.

The Committee advocated that registrars in general practice should be seconded from the teacher's practice in search of additional experience. Doctors who received registrars on secondment need not be approved teachers, and if their practices demonstrated special methods and procedures they need not secure formal approval.

The G.M.S. Committee approved a recommendation that travel and subsistence allowances should be paid by executive councils to registrars on approved visits away from the teacher's practice, and that doctors who had not been approved as teachers and who received registrars on approved visits should be paid an appropriate fee. It also recommended that doctors in training should be paid on an incremental scale in accordance with increasing experience, and that experience in general practice should be taken into account in assessing remuneration for any subsequent hospital appointments.

Dr. Howie Wood commented on the general-practice training posts in the Wessex region. If Wessex was to be a prototype for other schemes there should be a closer tie between the hospitals and the local medical committee's training subcommittee.

Mr. Bowie pointed out that he was presenting only an interim report, and the point would be followed up.

Fees for Dental Anaesthetics

Dr. Cameron said that the Ministry of of Health had been pressed to increase the fees for administering general anaesthesia for dental surgery. One of the difficulties was that dentists were paid from a global sum, so that fees for dental anaesthetics affected dentists' pay. It had been made clear to the Ministry that doctors did not want to embarrass the dentists. The G.M.S. Committee's representatives had put forward a case for paying anaesthetic fees through executive councils. The Ministry would now receive representations from the dentists, and ultimately there would be a reply to the Committee's representations.

Constitutional Reform

Dr. Cameron referred to the fact that the Annual Conference of Representatives of Local Medical Committees had been counted out before completing its agenda (*Supplement*, 1 July, p. 12). The recommendations on the new constitution of the G.M.S. Committee and of the Conference had therefore not been debated. The only thing that could be done, said Dr. Cameron, was to postpone further consideration until a future Conference. The remaining motions, other than those on the constitution, could be taken as references to the Committee.

The Committee agreed to this course of action.

Central Consultants and Specialists Committee

The C.C. and S. Committee discussed changes in its composition and in that of the Joint Consultants Committee. The representation of the special groups on the C.C. and S. Committee is to remain. It was recommended that the College of Pathologists and the Royal Medico-Psychological Association should be directly represented on the Joint Consultants Committee.

A meeting of the Central Consultants and Specialists Committee was held on 29 June. Mr. H. H. Langston was in the chair.

Composition of Committee

The Committee discussed its previous recommendations to the Council for a number of changes in the Committee's composition. The proposal to abolish the 11 seats allocated to the special groups of the Association had been referred back to the Committee by the Council for further consideration.

Dr. E. Grey-Turner (Deputy Secretary) reported that he had written to the chairmen of the special groups stating that it had been suggested that the seats reserved for the 11 specialist groups should be converted into seats available for co-option, and that in the event of any of the specialties not being otherwise represented on the C.C. and S. Committee a representative of that specialty should be co-opted from the relevant group committee.

The C.C. and S. Committee's executive committee thought that the membership of C.C. and S. Committee could not be reduced to 50 or 60, and the fact had to be faced that it would continue to be a large committee. The Council had taken the view that no committee with a membership of 90 could possibly be efficient, and that something must be done to reduce the membership of the C.C. and S. Committee to between 50 and 60.

The Chairman said that the Council had made great play of its belief that a committee of 90 must be ineffective, but there were never 90 members of the C.C. and S. Committee actually present, and the number attending was less than the membership of the Council itself. The C.C. and S. Committee did not meet frequently, and it tried to keep its expenses down by appointing subcommittees to do much of the work. The Chairman said he believed their work was efficient. The C.C. and S. Committee had decided that it would not help to reduce the number of members elected by the regions or the junior staff membership. It was important to have the two representatives from each region. The suggestion to abolish the representation from the special groups had been made with reluctance as one of the few ways in which a substantial reduction in the membership of the C.C. and S. Committee could be secured.

Special Treatment

Dr. J. G. L. Cole, of the Radiologists Group, said that he realized the central committee was large, but it was a debating chamber in which all shades of opinion could be, and were, expressed. Items not covered in debate were usually discussed by the executive and reported on to the full committee. The Radiologists Group believed that its representation on the C.C. and S. Committee was most valuable, and in this it was supported by the Faculty of Radiologists and by the members of the British Institute of Radiology. While the Radiologists Group would welcome the co-option of any radiologist if radiologists were not otherwise represented, there were difficulties such as replacement at short notice.

Why should radiologists ask for special treatment ? Most consultants had a channel through one or other of the Royal Colleges as well as through their regional representation, whereas minority groups had only one member on the Council of the Royal College of Surgeons of England. Radiological departments had administrative problems, shared only by pathologists, which were not fully understood by their clinical colleagues. Today the radiology department was involved in nearly everything that concerned the hospital service, such as hours of working, the provision of capital and buildings, the future development of the National Health Service, and the recruitment and training of ancillary staff. They were also concerned with hospital junior medical staff. It had been suggested that the C.C. and S. Committee might call on the advice of radiologists when matters in their particular field were to be discussed. But those occasions, said Dr. Cole, would be difficult to predict in a specialty which was involved in so many different fields. He asked that the radiologists' seat on the committee should be retained.

Mr. H. G. Hanley said that the difficulties referred to by Dr. Cole were common to all groups, and that was the strongest argument against having any special group representation on the Committee.

Professor I. Rannie pointed out that there might be members of the C.C. and S. Committee who were pathologists but they would not be there as representatives of pathologists, as the Consulting Pathologists Group representative would be. There should be members of the C.C. and S. Committee who represented their specialty, and he opposed a compromise.

Mr. **WALPOLE S. LEWIN** asked whether money was the main consideration. He noted that the G.M.S. Committee met very much more often than the C.C. and S. Committee. If the C.C. and S. Committee thought its structure was right it should say so, and it should not try to reach a compromise solution without good reason.

The **CHAIRMAN** pointed out that the G.M.S. Committee paid for its meetings out of its Defence Trust funds.

Dr. A. J. W. **BEARD** pointed out that there were anaesthetists on the C.C. and S. Committee other than the one appointed by the Anaesthetists Group, and one of these also served on the Council of the Association. But it could well happen that the representative elected locally was not on the Council. It was difficult enough for anaesthetists to keep their link with the B.M.A., something which they valued, without reducing their representation.

Mr. N. G. C. **HENDRY** reminded the Committee that Scotland had agreed to reduce its representation, and he said he had thought that other groups would have disciplined themselves in the same way. If the C.C. and S. Committee (Scotland) found that there was no substantial reduction elsewhere it would wish to reserve its position.

The **CHAIRMAN** said that the recommendation about the representation from Scotland had been passed by the Council, and it would be before the Annual Representative Meeting in Bristol.

The Committee voted in favour of continuing the representation of the special groups on the C.C. and S. Committee.

Joint Consultants Committee

The Committee approved the proposed new terms of reference of the Joint Consultants Committee. The Joint Consultants Committee wished to adopt the terms of reference and had sent them to the C.C. and S. Committee for its formal consent. The terms of reference were as follows:

(A) To formulate policy and to consider all matters of policy that may from time to time arise relating to consultant and hospital practice including (i) the maintenance of standards of professional knowledge and skill; (ii) the encouragement of education and research; and (iii) the utilization to the best advantage of skills and resources; but excluding the remuneration and terms of service of hospital medical and dental staff and so that the Committee shall not engage in the pursuit of political purposes.

(B) To discuss (either alone or jointly with other bodies) with the Ministry of Health, the Scottish Home and Health Department, and other appropriate bodies all matters falling within the terms of the foregoing paragraph.

(C) To nominate members of such bodies as the Committee may from time to time decide.

Composition of Joint Committee

The C.C. and S. Committee then proceeded to discuss the composition of the Joint Consultants Committee.

The Royal College of Physicians of London had proposed that the representation on the Joint Consultants Committee from the Royal Colleges should be increased by three. There were also formal applications to be admitted as constituent bodies of the Joint Committee from the College of Pathologists and from the Royal Medico-Psychological Association.

The **CHAIRMAN** reminded the C.C. and S. Committee that the existing membership of the Joint Consultants Committee was one chairman *ex officio,* 11 representatives from the Royal Colleges, 10 from the C.C. and S. Committee, two from the Central Dental Consultants and Specialists Committee of the British Dental Association, and one observer from Northern Ireland.

Sir **JOHN RICHARDSON** said that the dilemma was that a small committee was desirable but it did not wish to alter its current representation, because it had been found to be very satisfactory. The representation of sectional interests had been pressed for in the past, and it had been pointed out that, for example, pathologists could be appointed through their constituent bodies. But there had been mounting pressure from large bodies of doctors to have representation on the Joint Consultants Committee as of right. If that were accepted others would follow suit. The wish of the Royal College of Physicians to have three more representatives from the Royal Colleges was so that it could be ensured that three more sections of the profession should be represented on the Joint Committee. Whether that was satisfactory to the bodies concerned was a different matter.

Sir John thought the Joint Committee was not a committee where the balance of interests was so important. To talk about "increased representation on the College side" was an unfortunate way of putting it. It was meant to emphasize that members should be chosen because of their academic position. Something should be done for the new colleges and those which were likely to be formed in the near future. The issue was whether this way of maintaining the principle of no direct representation but of ensuring that those who should have a voice had it was satisfactory, or whether, with all the grave disadvantages of enlarging the committee, the new colleges should be granted direct representation. On balance, he was in favour of the first course.

Dr. **JOAN TAYLOR** supported the direct representation of the College of Pathologists. It was the third largest specialty group, and should be directly represented. It was probably the largest group of whole-time employees, and some of the troubles affecting the hospital service were not always covered by those who were employed part-time.

Knocking at Door

Dr. E. A. **HARVEY-SMITH** emphasized the need for good will. Both pathology and psychiatry were knocking at the door of the Joint Consultants Committee. It was better that they should be invited in with magnanimity rather than have to put up a fight. When the Joint Consultants Committee was set up there were only a certain number of Royal Colleges and they were represented directly. Had the other colleges been in existence then they would also have been represented directly.

Dr. H. **GLYN JONES** said that the balance between the representation of the C.C. and S. Committee and that of the other constituent bodies of the Joint Consultants Committee had to be borne in mind. It had been said that hospital doctors in the provinces were less interested in the affairs of the Joint Consultants Committee because it was no longer involved in negotiations. But the new terms of reference seemed to him to be as concerned with the interests of peripheral consultants as were the old. Surely, said Dr. Glyn Jones, the representation of the Royal College of Surgeons of England and of the Royal College of Physicians of London should be reduced from three to two, and there would then be two spare places which could go to the new colleges. If further colleges appeared in due course then, logically, the College's representation could come down to one each.

The C.C. and S. Committee agreed that there should be separate representation, directly, of the College of Pathologists and of the Royal Medico-Psychological Association on the Joint Consultants Committee.

The **CHAIRMAN** said that the question now remained whether that representation should be by three additional representatives, as suggested by the Royal College of Physicians of London, or by any particular number of additional representatives, or whether there should be a rearrangement of the representation of the existing constituent bodies.

Dr. A. **SKENE** said that the matter of proportionate representation was less important now. A possible answer was to suggest that the C.C. and S. Committee's own representation should be reduced from 10 to 9, making a place for one of the new bodies, and perhaps the Royal College of Physicians of London could reduce its representation by one.

In reply to a question, the **CHAIRMAN** said that proposals that the Full-time Medical Teachers and Research Workers Committee of the B.M.A. should have representation and that the Scottish Royal Colleges should be given increased representation would have to be considered in due course.

The C.C. and S. Committee voted against any increase in size of the Joint Consultants Committee, and it was decided that it should now be left to the Joint Consultants Committee to look at the matter further.

(A report of the remainder of the proceedings of the C.C. and S. Committee will be printed next week.)

B.M.A. Car-badge Scheme

The Chief Superintendent of the Hampshire Constabulary has agreed to the introduction of the B.M.A. Car-badge Scheme in the area of the city of Southampton. Application forms for badges for doctors practising in this area may now be obtained from the Secretary of the Association, B.M.A. House, Tavistock Square, London W.C.1.

Dangerous Drugs Act: Withdrawal of Authorities

The Home Office announces that Dr. Paul Coling (Chichester, Sussex) is no longer authorized to be in possession of or to prescribe those drugs to which the Dangerous Drugs Regulations, 1965, apply.

Highlands and Islands Medical Services

The Report of the "Birsay Committee"* was published last month. The Committee was appointed in 1964 by the Secretary of State for Scotland "To consider the arrangements for the provision of general medical services in the Highlands and Islands within the framework of the health services generally; and to make recommendations." The chairman was Lord Birsay and the four medical members were Drs. R. S. C. Fergusson, Thomas Scott, C. J. Swanson, and E. R. C. Walker.

The "Highlands and Islands" includes the counties of Argyll, Caithness, Inverness, Orkney, Ross and Cromarty, Sutherland, and Zetland, and covers 14,000 square miles out of the 30,000 square miles of Scotland. Only seven of the 118 inhabited islands had more than 2,000 inhabitants in 1961, and of the whole Highlands and Islands there were fewer than 278,000 people (about 1/20 of the Scottish population). In the ten years ending 1961 the population declined by 2.8%, despite an increase in some of the burghs, when the total population of Scotland increased by 1.6%. In the Committee's view these facts justified special measures. "Only a radical reshaping of the health service which succeeds in transcending the past administrative divisions," the report states, "will . . . be successful in creating the conditions for a steady development and improvement in the services to the public."

Problems of Practice

The Committee does not consider that there are too many doctors in the Highlands and Islands, and states that there will be a continuing need for general practitioners in the foreseeable future. The general medical services were not likely to become a function of hospital outpatient departments or clinics. Grouping of practices in certain areas would be valuable to ease the burden of continuous responsibility and to facilitate the provision of diagnostic and other equipment. Notwithstanding the importance of refresher training for doctors working in isolation the Committee did not think it should be compulsory. Close links between general practice and universities should be encouraged, and general practitioners should have responsibility for a "substantial element" of public health work and school medical examinations.

Attention is drawn to the special position of a rural doctor's wife as an ancillary helper, and it is recommended that this should be recognized in future reviews of the scheme for direct payments in respect of ancillary staff. It is also recommended that the standards to which new houses are built by executive councils for doctors should be kept under review, and the power of executive councils to provide residential accommodation should be widened to include separate main or branch surgeries. Hospitals might have to loan diagnostic equipment if good doctors are to be attracted to remote areas. The report suggests that part of the responsibility for providing locums could be borne by health service bodies without disturbing the "independent contractor" status of general practitioners.

The Committee does not favour a policy of extreme centralization of specialist services, and, in addition to frequent visits by consultants to peripheral areas, it considers there should be resident consultant physicians in the Orkney and Shetland Islands. It also considers that general practitioners must work more in hospitals.

Remuneration

The Committee sees no difficulty in principle about paying a salary to doctors who want to be paid in that way and who work in health centres in isolated areas where they are not directly in competition with professional colleagues. It would not favour any measures to change the independent contractor status of any doctor against his will. Experimental patterns of salaried medical provision in self-contained areas such as Orkney should be encouraged, but an organized salaried service for the whole of the Highlands and Islands area is not recommended.

The Committee believes that inducement payments to provide general practitioners in sparsely populated areas with a predetermined income no longer provide an adequate basis for settling remuneration, and it recommends that there should be a special Highlands and Islands practice allowance to take the place of both mileage payments and inducement payments. The allowance should be determined by the nature of the practice.

Administration

The existing administrative structure of the National Health Service is criticized. The Committee states that it is clear that shared membership of the three administrative arms of the service did not overcome the tendency to uncoordinated development. The Committee recommends that there should be a Highlands and Islands Health Board responsible for all aspects of the National Health Service, with nine area boards to undertake the day-to-day running of a unified service in various parts of the region.

Reservation

In some reservations on the report Dr. Fergusson thought that there was a danger in the proposal for a Highlands and Islands Health Board of creating something remote and impersonal. Dr. Fergusson also did not consider that the existing remuneration structure would attract and keep good doctors, nor did he think the introduction of a Highlands and Islands practice allowance in the form proposed in the Committee's report would do so. He thought that a much smaller practice allowance in addition to all other payments, including mileage, and tapered along similar lines to those suggested in the report had much to commend it.

---

Flashing Light for Doctors' Cars

The new Mediflash emergency light for doctors' cars (see advertisement page xxi) may be purchased subject to the following conditions. (1) It is to be used only by registered medical practitioners when travelling to medical emergencies. (2) The use of the light confers no exemption from the observance of traffic regulations and of speed limits. (3) In the event of the light being lost or stolen the B.M.A. must be informed immediately. (4) The light must not be sold or transferred to another practitioner.

The question of an emergency sign for use on doctors' cars was referred to in the Annual Report of the Council (*Supplement*, 6 May, p. 58). Doctors wishing to buy a Mediflash light should write to the Secretary of the British Medical Association for an application form.

Hospitality

A French doctor living in Yerres, Essone, would like his 14-year-old son to stay with a British medical family from 5 to 31 August. In exchange the doctor would be pleased to receive a British boy of similar age at a mutually convenient time.

A French doctor living in Louveciennes (Seine-et-Oise) would like his 16-year-old daughter to stay with a British medical family for a month from 15 August. In exchange the doctor would be pleased to receive a British girl of similar age at Christmas or at Easter or in the summer of 1968.

A French doctor living in Dieppe would like his 18-year-old daughter to stay with a British medical family in the south of England or in London for 2 weeks from 3 August. In exchange the doctor would be pleased to receive a British girl of similar age at a mutually convenient time.

A French doctor living in Anzin would like his 20-year-old daughter to stay *au pair* with a British medical family from October to Easter. She would be pleased to help look after children.

Would anyone who is interested please get in touch with Dr. R. A. Pallister, Medical Director, International Medical Advisory Bureau, B.M.A. House, Tavistock Square, London W.C.1.

Branch and Division Meetings to be Held

Honorary Secretaries of Branches and Divisions are asked to send notices of meetings to the Editor at least 14 days before they are to be held.

Members proposing to attend meetings marked ● are asked to notify in advance the honorary secretary concerned.

BIRMINGHAM DIVISION.—A summer party was held on 8 June at Charlecote Park, Warwickshire, by invitation of Major Sir Brian Fulke Cameron Ramsay-Fairfax-Lucy, Bt. In addition to the grounds, members were able to visit the deer park, the malt house, and the museum.

BRIGHTON AND MID-SUSSEX DIVISION.—At Postgraduate Medical Centre, Brighton General Hospital, Tuesday, 4 July, 8.30 p.m., meeting to instruct Representatives and to consider motions to Annual Representative Meeting.

LANCASTER DIVISION.—At Postgraduate Medical Centre, Ashton Road, Monday, 3 July, 8.30 p.m., general meeting to instruct representatives to Annual Representative Meeting.

NORTH BEDFORDSHIRE DIVISION.—At Medical Institute, Bedford General Hospital, Thursday, 13 July, 8.30 p.m., general meeting to receive report of representative to Annual Representative Meeting.

NORWICH DIVISION.—Thursday, 13 July, 2.15 p.m., visit to Sewage Purification Works, Whitlingham. Guests are invited.●

WEST NORFOLK DIVISION.—At King's Lynn Golf Club, Wednesday, 5 July, 12.15 for 12.30 p.m., annual general meeting followed by lunch.●

PUBLIC HEALTH MEDICAL OFFICERS: BIRMINGHAM REGION.—At 36 Harborne Road, Edgbaston, Tuesday, 11 July, 5.15 p.m., meeting.

Meetings of Branches and Divisions

BURY DIVISION.—The annual general meeting of the Division was held on 16 May at the Royal Hotel, Bury. Dr. J. B. Law was in the chair, and 20 members were present.

Branch and Division Officers Elected

BIRMINGHAM DIVISION.—Chairman, Dr. D. F. Heath. Vice-chairman, Dr. M. Sim. Honorary Secretary and Treasurer, Dr. A. L. Lloyd.

BLACKPOOL AND FYLDE DIVISION.—Chairman, Dr. I. McD. G. Stewart. Chairman-elect, Dr. A. C. Ferguson. Honorary Secretary and Treasurer, Dr. L. W. Atkinson.

BORDER COUNTIES BRANCH.—President, Dr. J. S. Moffat. President-elect, Dr. R. B. Wilson. Vice-presidents, Dr. A. M. Rankin, Dr. H. Maclean. Honorary Secretary and Treasurer, Dr. J. Hogg Smith.

BROMLEY DIVISION.—Chairman, Dr. J. C. Brocklehurst. Chairman-elect, Dr. G. A. Griffin. Honorary Secretary and Treasurer, Dr. E. M. Shipsey.

BURY DIVISION.—Chairman, Dr. J. B. Law. Vice-chairman, Dr. G. A. Levell. Honorary Secretary, Dr. J. S. Guinan. Assistant Honorary Secretary, Dr. A. E. Fishburn. Honorary Treasurer, D. R. S. Savidge.

CAMBERWELL DIVISION.—Chairman, Dr. S. Slovick. Vice-chairman, Dr. A. Clark Jones. Honorary Secretary and Treasurer, Dr. W. B. J. Pemberton.

CAMDEN DIVISION.—Chairman, Dr. Lena Williams. Vice-chairman, Dr. L. Stoll. Honorary Secretary and Treasurer, Dr. T. P. Linehan. Assistant Honorary Secretary and Treasurer, Dr. S. E. Josse.

CHESTERFIELD DIVISION.—Chairman, Dr. D. R. Lewis. Vice-chairman, Dr. W. G. Wells. Honorary Secretary, Dr. L. L. Ralph. Assistant Honorary Secretary and Treasurer, Dr. D. J. Hunt.

CITY OF EDINBURGH DIVISION.—Chairman, Dr. Betty C. Hamilton. Vice-chairman, Dr. W. S. Dalgetty. Honorary Secreary and Treasurer, Dr. Joan K. Sutherland. Assistant Honorary Secretary, Dr. A. G. Donald.

CLEVELAND AND MIDDLESBROUGH DIVISION.—Chairman, Dr. G. Blair. Chairman-elect, Dr. R. H. R. Renwick. Vice-chairman, Dr. W. M. Morgan. Honorary Secretary and Treasurer, Mr. R. Cowley. Assistant Honorary Secretary, Dr. D. S. Strachan.

CONSETT DIVISION.—Chairman, Dr. D. H. Bailey. Chairman-elect and Vice-chairman, Mr. G. I. B. Da Costa. Honorary Secretary and Treasurer, Dr. J. I. McL. Forsyth.

COUNTY OF ANGUS DIVISION.—Chairman, Dr. J. B. Miller. Vice-chairman, Dr. Ewen Taylor. Honorary Secretary, Dr. William Dodd. Honorary Treasurer, Dr. E. G. Jenner.

COVENTRY DIVISION.—Chairman, Dr. J. Catto. Chairman-elect, Mr. Richard Shaw. Vice-chairman, Dr. A. C. Kendall. Honorary Secretary, Dr. D. G. Scott. Honorary Treasurer, Dr. D. Patchett.

CREWE DIVISION.—Chairman, Mr. H. Hassall. Vice-chairman, Dr. Gretel Bergheimer. Honorary Secretary, Dr. R. D. Currie. Honorary Treasurer, Dr. F. W. Blacklay.

DEWSBURY DIVISION.—Chairman, Dr. E. B. Harrison. Chairman-elect and Vice-chairman, Mr. H. N. Burwell. Honorary Secretary and Treasurer, Dr. Valerie Platts.

DONCASTER DIVISION.—Chairman, Dr. W. E. McPhillimy. Vice-Chairman, Dr. C. F. Coutts-Wood. Honorary Secretary, Dr. W. J. B. Templeton. Assistant Honorary Secretary, Dr. G. C. McGlone. Honorary Treasurer, Dr. H. F. Clay.

EAST KENT DIVISION.—Chairman, Dr. D. O. Davies. Vice-chairman, Dr. Q. F. Evans. Honorary Secretary, Dr. G. W. Stuart. Honorary Treasurer, Dr. W. Sutcliffe.

EAST AND MIDLOTHIAN DIVISION.—Chairman and Chairman-elect, Dr. A. S. Watson. Vice-chairman, Dr. H. D. Wilson. Honorary Secretary and Treasurer, Dr. C. C. Lutton.

EAST YORKSHIRE BRANCH.—President, Dr. J. N. Redfern. President-elect, Dr. R. L. Luffingham. Vice-president, Dr. B. Reffold. Joint Honorary Secretaries, Dr. R. L. Luffingham, and Dr. S. T. Lunt. Honorary Treasurer, Dr. O. G. Prosser.

ENFIELD AND POTTERS BAR DIVISION.—Chairman, Dr. C. Crampton. Chairman-elect, Dr. L. E. L. Ridge. Honorary Secretary and Treasurer, Dr. H. R. Shepherd.

HASTINGS DIVISION.—Chairman, Dr. L. G. Scott. Vice-chairman, Mr. C. F. Mayne. Joint Honorary Secretaries, Dr. T. K. Bradford, Dr. A. J. Mitchell. Honorary Treasurer, Dr. T. K. Bradford.

HENDON DIVISION.—Chairman, Dr. A. D. Manning. Vice-chairman, Dr. H. Maxwell. Honorary Secretary and Treasurer, Dr. J. W. McCarthy.

HUNTINGDON AND PETERBOROUGH DIVISION.—Chairman, Dr. H. M. Weaver. Vice-chairman, Dr. K. D. Allanby. Honorary Secretary and Treasurer, Dr. J. K. Murphy. Assistant Honorary Secretary, Dr. J. Harkness.

ISLE OF ELY DIVISION.—Chairman, Dr. J. R. Morton. Vice-chairman, Dr. G. A. H. Cookson. Honorary Secretary and Treasurer, Dr. H. McColl.

LAMBETH DIVISION.—Chairman, Dr. T. A. V. Brooks. Vice-chairman, Dr. R. J. Smith. Honorary Secretary, Dr. J. A. Gavin. Honorary Treasurer, Dr. T. A. V. Brooks.

LANCASTER DIVISION.—Chairman, Mr. G. Freeman. Chairman-elect and Vice-chairman, Dr. S. Smith. Honorary Secretary, Dr. Jean L. Ward. Honorary Treasurer, Dr. R. J. Howat.

LEEDS DIVISION.—Chairman, Dr. J. R. B. Turner. Vice-chairman, Mr. T. F. Redman. Honorary Secretary, Dr. G. W. J. Hawbrook. Assistant Honorary Secretary, Dr. J. M. Thomas. Honorary Treasurer, Dr. G. E. Welch.

MORPETH DIVISION.—Chairman, Dr. D. Irwin. Vice-chairman, Dr. T. S. Blaiklock. Honorary Secretary, Dr. F. J. Wilkinson. Honorary Treasurer, Dr. G. F. G. Woodman.

NORTH BEDFORDSHIRE DIVISION.—Chairman, Dr. M. G. L. Lucas. Chairman-elect and Vice-chairman, Dr. J. D. Harte. Honorary Secretary, Dr. V. E. Collinson. Assistant Honorary Secretary, Dr. M. A. Cole. Honorary Treasurer, Dr. A. Obertelli.

NORTH DEVON DIVISION.—Chairman, Dr. J. S. T. Searle. Chairman-elect and Vice-chairman, Dr. A. J. Bray. Honorary Secretary, Dr. B. J. Muir. Assistant Honorary Secretary, Dr. A. J. Edwards. Honorary Treasurer, Dr. E. Lindsay.

NORTH LANCASHIRE AND WESTMORLAND BRANCH.—President, Dr. F. T. Madge. Vice-presidents, Dr. J. L. Skene, Dr. A. B. Lishman. Honorary Secretary and Treasurer, Dr. W. M. Thomas.

NORTH STAFFORDSHIRE DIVISION.—Chairman, Dr. A. J. McCall. Chairman-elect, Dr. B. Hyde. Honorary Secretary, Dr. S. R. Fee. Assistant Honorary Secretaries, Dr. A. E. Hugh, Dr. B. Hyde, Dr. W. N. Stirling. Honorary Treasurer, Mr. J. S. Ramage.

SOMERSET DIVISION.—Chairman, Dr. B. J. Douglas Smith. Chairman-elect, Dr. M. M. Johnston. Vice-chairman, Dr. A. Parry Jones. Honorary Secretary and Treasurer, Dr. M. J. Forth. Assistant Honorary Secretary, Dr. G. R. Stevenson.

SOUTH STAFFS DIVISION.—Chairman, Dr. H. A. S. Walker. Chairman-elect, Mr. R. G. Hughes. Vice-chairman, Mr. C. M. C. Potter. Honorary Secretary and Treasurer, Dr. H. R. Marker. Assistant Honorary Secretary, Dr. N. McLeod.

STAFFORDSHIRE BRANCH.—President, Dr. C. H. Catlin. Vice-presidents, Dr. H. J. Browne, and Mr. J. C. Newbold. Honorary Secretary and Treasurer, Dr. R. W. Rae.

STIRLING BRANCH—President, Dr. G. C. Chessor. President-elect, Mr. G. L. Reid. Vice-president, Dr. G. Smith. Honorary Secretary and Treasurer, Dr. R. T. Campbell.

SUNDERLAND DIVISION.—Chairman, Dr. B. Gordon. Vice-chairman, Dr. P. Inman. Honorary Secretary, Dr. C. Nelson. Honorary Treasurer, Dr. B. Tindle.

THAMES VALLEY DIVISION.—Chairman, Dr. M. Webber. Vice-chairman, Dr. P. H. A. Willcox. Honorary Secretary and Treasurer, Dr. D. Paton. Assistant Honorary Secretary, Dr. M. Charrett.

WEST LONDON DIVISION.—Chairman, Dr. J. L. Kearns. Vice-chairmen, Dr. W. Gunn and Dr. D. J. Thomas. Honorary Secretary, Dr. G. Moses. Honorary Treasurer, Dr. M. M. Marks.

British Medical Association

Annual Representative Meeting, Bristol, 1967

Nearly 500 representatives from home and overseas constituencies attended the Annual Representative Meeting of the Association held in the Anson Hall, University Union, Bristol, from 6 July to 10 July, to debate an agenda of over 600 items. It was the largest agenda that the Representative Body had ever had to consider.

First day: Thursday, 6 July

DR. A. N. MATHIAS, Chairman of the Representative Body, was in the chair, and he was supported on the platform by Professor Hamid Ali M. Khan; Dr. Ronald Gibson, Chairman of Council; Dr. S. Wand, Treasurer; Mr. R. V. Cooke (Bristol), President-elect; and Dr. A. M. Maiden, Deputy Chairman of the Representative Body.

Preliminary

President 1969–70

On the motion of the CHAIRMAN OF COUNCIL, Dr. James William Howie, M.D., F.R.C.P.(London), F.R.C.P.(Glasgow) was elected President of the Association for the Session 1969–70.

Election of Vice-Presidents

On the motion of the CHAIRMAN OF COUNCIL, Dr. Thomas Rowland Hill, M.D., F.R.C.P., was elected posthumously a Vice-President of the Association in recognition of his valuable services to the Association; and Dr. John Oubridge Mercer, C.B.E., M.B., Ch.B., F.R.C.P.(London), F.R.A.C.P., M.A.C.P., was also elected a Vice-President of the Association in recognition of his outstanding services to the Association and to the profession.

Service Representative on Council

On the motion of the CHAIRMAN OF COUNCIL, Surgeon Captain P. G. Burgess was elected as the representative of the Royal Naval Medical Services on the Council for the three years 1967–70.

Civic Welcome

At 10.30 a.m. the Meeting suspended its business to receive the Lord Mayor of Bristol, Alderman the Rev. F. C. Vyvyan-Jones. The LORD MAYOR welcomed the British Medical Association to Bristol. After reviewing some notable events he expressed the hope that representatives would enjoy their stay.

The CHAIRMAN thanked the Lord Mayor for his welcome.

Presentation of Banner

Mrs. ANGELL JAMES, wife of the Chairman of the Bristol Division, presented to the B.M.A. on behalf of the Bristol Division a banner to mark the occasion of the Annual Representative Meeting being held in Bristol. The banner had been designed by the West of England College of Art, and the work had been executed by Miss Cook, who was on the staff of the Connaught Girls' School in Bristol.

The CHAIRMAN thanked Mrs. James on behalf of the Association.

Preliminary (Resumed)

The CHAIRMAN OF COUNCIL, on behalf of the Council, moved: "That the Annual and Supplementary Report of Council under 'Preliminary' (Doc. A.R.M. 2, paragraphs 1–16, and A.R.M. 2A, paragraph 289) and the Index of A.R.M. Resolutions, 1966 (Appendix I), be received."

Dr. GIBSON said it was his duty to give members an account of Council's work during the past year. Soon after the year started the Government's Prices and Incomes standstill had been announced. The Council had come to the conclusion that it should advise the profession to accept the freeze, with two strong reservations. The first was that if circumstances changed the Association would reserve the right to take any action necessary to preserve the profession's position. The second was that the Council would proceed to take strenuous action on behalf of the four small and important groups of the profession who had been most badly hit by Government's action—the medical officers of health, doctors in the armed Forces, university clinical teachers, and junior doctors in the hospital service. The Association had black-listed both the armed Forces and the local authority health services. In both cases it was proposed to maintain that argument until the effect became insupportable to those who were denying those doctors their just due. There had been remarkable and far-reaching changes within the hospital service. The new B.M.A. constitution would provide the widest opportunity for hospital doctors to make their voices heard and their influence felt. It was up to them to use the B.M.A. machine to the full. To split the ranks of young doctors at a vital stage in their negotiations could only weaken their cause at a time when it needed all the strength it could muster. It was not a time for treachery, but a time for loyalty and unity.

Dr. Gibson said he wanted particularly to emphasize the position of the university clinical teachers. They had had no increase in their remuneration since 1963. They had been excluded from an award of 14% in 1964, and, similarly, of 5% in 1965. The Review Body had made no specific reference to them. They were then offered 10%, and the B.M.A. calculated that 2,000 doctors were being offered the equivalent of an increase of 2.8% per annum since 1963. "This," said Dr. Gibson, "was taken by the Government as being substantial, and thus, under the latest White Paper, as subject to phasing, or payment by instalments. This was taken by us, on the other hand, as being disgraceful—and we said so.

"These doctors comprise probably the most important section of our profession, for they are charged with the training of the doctors of the future. This, therefore—to us at any rate—constituted a casting away of responsibility at the highest level. I am glad to say that the award—if such it can be called—is now to be paid in full retrospectively from October last year."

Dr. Gibson said that it had been a hard and testing year and one which had brought few rewards. But at least the B.M.A. had not stood on the fence or on the defence, nor would it do so in the year to come. The Association was charged also with the promotion of the medical and allied sciences. Here again the Association's activities had been many. They had included active participation with the Royal College of Obstetricians and Gynaecologists on the subject of therapeutic abortion, and a continuation of the role in the various discussions and debates on habit-forming drugs. Written and oral evidence had been given to the General Medical Council and to the Royal Commission on Medical Education, as a result of which the B.M.A. had been asked to produce a new edition of its booklet *Becoming a Doctor*, and to produce a new booklet on careers in medicine. "We are deeply concerned," said Dr. Gibson, "that the Association has not been included in the membership of the new Central Committee on Medical Education. All our efforts to obtain membership have been repulsed. Yet we are determined to pursue an active role in this important field."

Science Education and Planning

He was pleased to say that the Royal Colleges and some of the specialist associations had agreed to take a part in all future B.M.A. Annual Clinical and Scientific Meetings. That was a great step forward. Dr. Gibson referred to the development of the B.M.A.'s scientific and educational activities in the establishment of a department of audio-visual communications. He acknowledged the Association's debt here to the Life Offices Association and the Association of Scottish Life Offices in forming with the B.M.A. a trust for health education. The director of the department would be Mr. Charles Engel.

A managerial board for "Family Doctor" publications had now been appointed, and the new medical editor was Dr. Trevor Weston, who had already started work. Mr. Brian Edsall would continue as manager and Miss Evelyn Brown as subeditor. The reaction of the press and of the public to the regrettable but necessary closing down of the main magazine had more than ever persuaded the Council of the need for the Association's health education booklets. So *You and Your Baby*, parts one and two, *Getting Married*, and *Health on Holiday* could now continue to be published, and the Council also hoped to be able to expand in the health education booklet field.

Dr. Gibson said he hoped that so far he had been painting a picture of an Association which was active and forward-looking. That brought him "to one of the most important sections of my remarks, one of which I know the Representative Body would approve, and this is the formation of our Planning Unit under the direction of Professor Henry Miller, of Newcastle." Projects the unit had initiated to date included a panel on mechanical aids for the disabled, a panel on intensive therapy units, and an investigation into computer science in relation to medicine. A booklet on research projects was to be prepared. Organizational problems of the Health Service were being tackled from the beginning with an analysis into the problems of furnishing primary medical care. The unit intended to keep in touch with Divisions and Branches through specially appointed liaison officers.

Under planning, Dr. Gibson said he must also mention Dr. Ivor Jones and his team of workers who were researching into the history of the National Health Service from its original conception, and the successful conferences held by the Committee on Science, Education, and Research on computers in medicine.

The Council had had discussions with the Ministry of Health on Britain's possible entry into the European Economic Community. The B.M.A. had a special Common Market Committee and it had observers on the permanent Committee and on the Committee of Specialists of Common Market countries. The main effect that mattered to doctors was the mutual recognition of legally accepted medical qualifications. Once that was done doctors would be free to move about the community and to practise, but they would have to obey the laws affecting medical practice in the country in which they were practising. The Ministry had suggested, and the Council had agreed to, a small liaison committee by the B.M.A. and the Ministry which could keep each other informed of moves affecting Britain's entry into the Common Market, and this had been set up.

Communications

Dr. GIBSON continued: "I have talked about the Association being active and forward-looking, and I feel strongly that this is the theme that should dominate this meeting. But a theme, if it is to be sustained, has to be developed, broadcast, heard, and understood. And it is in this respect that we seem still to be failing. Yet why should this be?" Dr. Gibson listed the contacts that some of the officers and officials of the B.M.A. had had during the year. In November and December he and Dr. D. P. Stevenson, the Secretary, in between attending the World Medical Association meetings in Manila, a conference on medical education in Delhi, and the combined Annual Meeting of the B.M.A. and the Pakistan Medical Association, together with a Commonwealth Conference in Karachi, had met doctors in Hong Kong, Singapore, Malaysia, New Zealand, and Australia. Dr. D. Gullick, Under Secretary, had visited Malta, Cyprus, and branches or affiliated associations in East Africa. The Lebanon, Gambia, Sierra Leone, and Nigeria had also been visited, and the Treasurer, Dr. S. Wand, visited Mauritius on his way back from Karachi, and the Chairman of the Representative Body, Dr. Mathias, had been in New Zealand. He (Dr. Gibson) and Dr. Stevenson had attended a conference of B.M.A. Caribbean branches in Antigua, and had called at Jamaica. There had been the excellent clinical meeting in April in Londonderry. Dr. Gibson said he had visited Dublin, and Dr. Stevenson had just returned from addressing the Canadian Medical Association during its Centenary Meeting. Dr. Gibson hoped the meeting would agree that the Council was doing its best to help doctors within the Commonwealth in their many problems.

At home there has been considerable activity, said Dr. Gibson. He referred to the conference on the future of British medicine, held in Newcastle, and another in Manchester on drug addiction. He thought the Junior Members Forum was the best he had ever attended, and he hoped young doctors would find in the Forum a powerful platform from which to express their views. Members of the Secretariat had been visiting Branches and Divisions during the year. Dr. J. C. Cameron, Mr. H. H. Langston, Dr. J. S. Noble, and Dr. I. M. Jones—"to mention only four of our very active Chairmen of Standing Committees"—had been out and about all the year, and Dr. Gibson said he had done a tour in the course of which he had met and talked to over 500 doctors of all sorts and kinds.

"So it can be said with the utmost assurance (Dr. Gibson continued) that, wherever he or she may be, practically every member of the B.M.A.—indeed, every doctor, whether a member or not—has had an opportunity to see and talk to the officers and/or officials of the Association during the past year. This opportunity for personal contact has been supplemented by *B.M.A. News*, by means of which factual information on day-to-day affairs has been put through the letter-boxes of some 50,000 doctors six times during the year. "I know that six times is not enough, but there are difficulties here of which I may have an opportunity to speak later in the Meeting if the occasion arises."

Insufficient Impact

"Yet, Sir, I remain profoundly disturbed at the undoubted fact that we are still not reaching or making a sufficient impact on the mass of doctors in the profession. For example, I calculated that I had spoken individually to 500 doctors during my tour, yet, if my arithmetic is correct, I believe there were 5,974 doctors in the 14 areas I visited. From the point of view of personal contact—if from no other point of view—my tour was therefore a colossal flop, yet I do not know what more could be done to prove the good intentions of the B.M.A. and keep contact with and be of service to its members."

If it was to be accepted—as Dr. Gibson hoped it would be—that a policy of activity, of planning, and of increasing services to members was the right one, there was no point at all in pursuing the policy if the machinery for sustaining it was missing. "We are at present working in the 60's with a constitution that creaks in practically every joint and is not geared to progress in modern fields of medico-politics or of medico-science. We need for one thing active regional machinery, in which all branches of the profession, large and small, can see their interests being furthered and can find it worth while to take a personal role in the work there is to do. We need regional secretaries who can translate policy locally, make personal contact with members, recruit members, service regional councils and committees, and in general bring to life in all parts of the country the picture I have sketched here—albeit inadequately—of an Association that is on the move.

"The Council, Sir, finds no need or reason for standing on the defensive. We are prepared to attack, and indeed have done so on more than one occasion last year. We find no reason for looking backwards over our shoulders—we are looking into and planning for the future. But all this is a sterile policy if voices cannot be raised loudly enough or words written clearly enough for members who do not wish to hear or to read to be persuaded to do both, and to do it abundantly. It is only by the greatest number of doctors being fully and continually aware of what is going on and of taking an active part in it. . . . I appeal to the Representative Body, therefore, to give us the machinery we need for our work in 1967–8, and I in return, on behalf of your Council, will give you a pledge that it will be no fault of ours if the results this Body is expecting from us are not achieved."

Planning

Dr. D. **Burrell** (Winchester) moved: "That this Meeting considers that the lack of planning of total medical needs in all areas (and in particular in developing areas) is a national disgrace and that Council be instructed to initiate an inquiry forthwith to achieve a formula whereby the maximum efficiency of medical care may be ensured in all areas by effective overall planning."

Dr. Burrell said he wondered if during his tour of the regions Dr. Gibson had found that lack of planning had led to duplication of services—and worse to total lack of appropriate services and personnel.

New hospitals were still being built without adequate facilities for hospital junior staff and nursing staff. In a proposed new hospital in north Hampshire no junior staff quarters or nursing accommodation had been provided. Even now doctors were asked to start practice from a council house in the midst of an estate.

The profession needed to know how far general practitioners could be integrated with the hospitals, and to be able to assess the needs of general practitioners, consultants, nursing and auxiliary help, and a host of other medical factors in each area. Doctors needed to know how much could legitimately be done by ancillary staff, and how they could be freed to do the essential medical work for which they were qualified.

Dr. **Gibson** suggested that the motion should be referred to the Council, so that the mechanics could be worked out as quickly as possible.

Dr. **Burrell** agreed, and the motion was carried as a reference to Council.

•

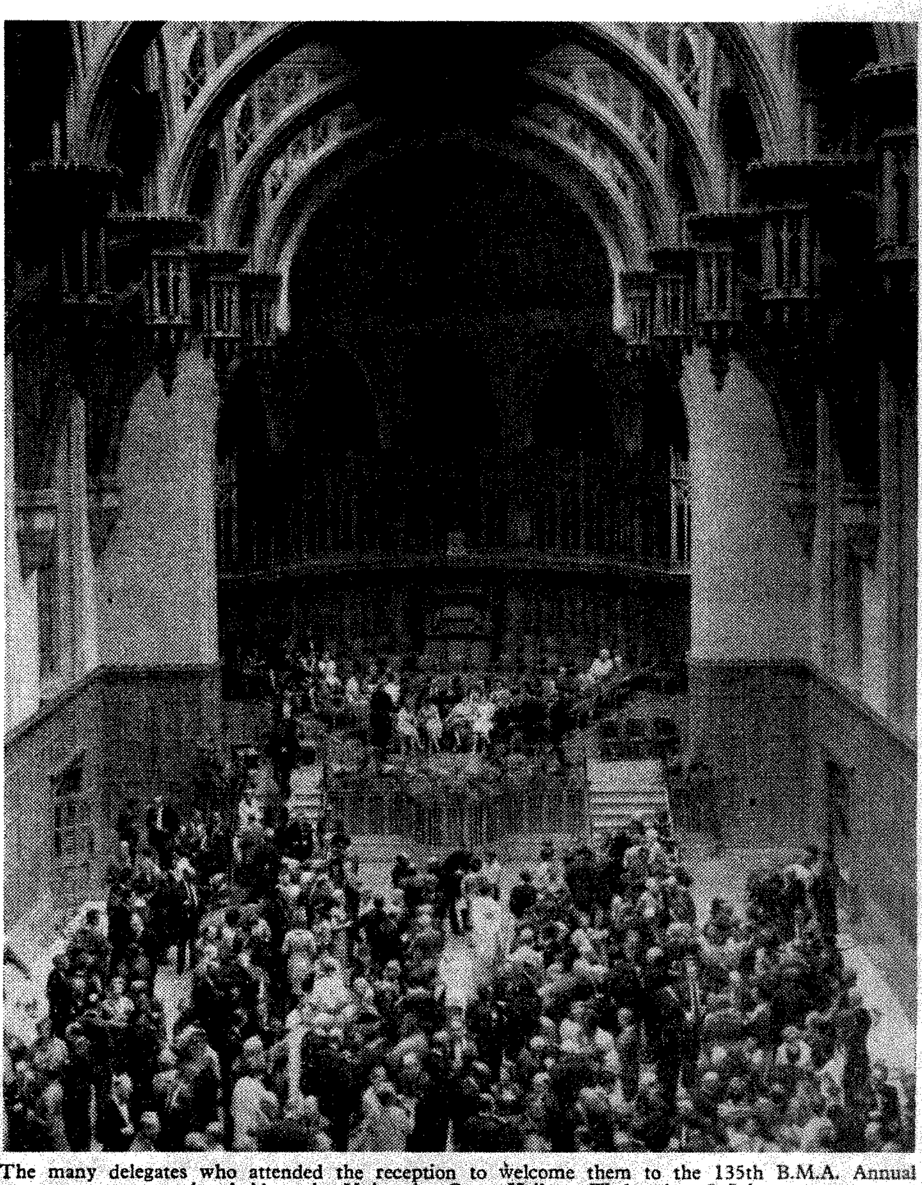
Alternative Service

Dr. W. S. S. **Maclay** (Guildford) moved: "That the results of the recent negotiations with the Ministry of Health have done little to alter the deficiencies of the National Health Service, the majority of which stem from the inadequate finance which is available at present, or will be available in the future, from direct taxation. The Annual Representative Meeting instructs Council to use whatever method it chooses to prepare an alternative Health Service. That this alternative shall be presented with adequate time for discussion by the profession before the Annual Representative Meeting in 1968."

Dr. Maclay said he was sure it would be agreed that some form of national health service was necessary in most countries. Britain's N.H.S. had remained basically unchanged for 20 years in spite of the fact that many of its faults and deficiencies had been recognized for many years. Recent negotiations and the Seventh Report of the Review Body had put money into doctors' pockets but had done little to ease their day-to-day work or to improve the standard of medical care. Among the faults of the N.H.S. was the fact that it remained irrevocably split into its three disciplines. Opportunities for an increase in preventive health services remained inadequate. There were insufficient beds and facilities for the care of old people. The conditions of many of the country's mental hospitals were so poor that doctors would not like to see one of their own relatives admitted to one. In-service training programmes for hospital junior doctors were not good enough. There were many other examples.

The present system of financing the N.H.S. from Treasury funds had produced insufficient money to carry out the improvements everyone wished to see. The percentage of the gross national product expended on medical care remained less than that in many other Western countries, notably the U.S.A. Patients should be given the opportunity to pay for extra service and medical attention. It was evident many were keen to pay for better medical care from the recent expansion of B.U.P.A. Since the introduction of the N.H.S. in Britain in 1948 other countries had started health services, but none had considered Britain's to be a good enough example to copy. Health services now existed in many countries. Britain could learn from the experience of others and prepare an alternative form of health service.

The general practitioner's "Charter" had been produced in one week-end, said Dr.



The many delegates who attended the reception to welcome them to the 135th B.M.A. Annual meeting held at the University Great Hall on Wednesday, 5 July.

Maclay. The B.M.A. could and should produce an alternative national health service within six months, so that it could be discussed in the Divisions before the A.R.M. of 1968.

Inaccurate and Irrelevant

Dr. E. TOWNSEND (Cornwall) opposed the motion as being inaccurate, tendentious, and irrelevant to the real business of the Association. It was inaccurate, said Dr. Townsend, because it was untrue to say that the negotiations had done little to alter the deficiencies of the N.H.S. There was solid evidence that quite a lot of good had come out of the recent negotiations. One example was that the Ministry of Health returns for the last quarter showed that for the first time for nearly 18 months there had been an increase in the number of general practitioners.

The effect of the negotiations on general practice had been considerable—new premises, ancillary help, health centres, preventive measures—and it could not be said that these had had no effect. The new contract had been introduced only three months before. It was untrue that the majority of deficiencies in the Health Service stemmed from insufficient finance, Dr. Townsend went on. The real faults of the Health Service now were its faulty administrative structure, the lack of creative and long-term planning and direction of the resources that existed, faulty use of resources (particularly faulty use of medical manpower), and failure to educate the public in how the Health Service should be used.

It was not, he said, the business of the B.M.A. to produce a health service. It was their job to see that any existing health service was run reasonably and properly.

Dr. G. R. OUTWIN (Council) said that a year ago the Association had had its chance to set the profession apart from party politics and to leave the economics of the Welfare State as a matter to be negotiated between the patient and the Governmnt. Surely, said Dr. Outwin, representatives must realize that the profession would never achieve what it really required by negotiation, because no politician would ever release his hold on the Health Service. The Association had been given the power to force the issue and had failed—but not because it did not know where it wanted to go or how to get there, nor because it had no alternative to follow. The Amending Acts Committee had produced an alternative scheme much better than that produced in a different context since then.

Was the profession to go on producing schemes for evermore, Dr. Outwin asked, without putting the ultimate weapon into effect? The B.M.A. could achieve these ends, but a new spirit of aggressiveness would have to be injected if the profession was to place its faith in the B.M.A. in the future.

Dr. J. H. NEWMARK (Sutton) supported the motion. On the last occasion that a similar type of motion had been brought before the A.R.M. the Review Body had been considering general practice. This position no longer existed, and if the motion was accepted the Council would be given ample opportunity to suggest a health service which could integrate all sections of medical practice in a way which would satisfy everybody.

Efficiency

Dr. G. E. CRAWFORD (Liverpool) said everyone agreed that the National Health Service as at present organized required increased efficiency, mostly in the hospital service. It would be well to let the public know what the results of using modern techniques could be. He quoted the following passages from Payne's *Introduction to Medical Automation*, which he thought were relevant. "At the margin of progress there are computer storage devices which can store ten million records and select any particular one in less than one-fiftieth of a second. . . . It is technically feasible, and indeed many such systems exist outside the medical field, to have data entered directly into the computer from teleprinters and such like stationed locally in wards, clinics, laboratories, the pharmacy, and so on so that the central computer file is immediately updated. Equally it could be directly interrogated at any time by anyone requiring the answers to specific questions."

These techniques would be available to the Government in the near future. The country had been aghast when the Home Secretary had suggested that everyone's fingerprints should be taken for record purposes. The Minister of Health and the Government would have data which would make fingerprints seem like "a mere drop in the ocean." When the public knew what was going on it would demand an alternative health service, said Dr. Crawford.

Dr. I. M. JONES (Council) hoped the Meeting would overwhelmingly support the motion. It was part of the task which had already been remitted to the new Planning Unit and to the panel of which he was chairman. The N.H.S. was inadequately financed, under-manpowered, and imperfectly organized to bring all the resources of modern medicine to the community. All over the world health services were coming into being, and time was showing each of them to be deficient in some respect or other.

His criticism of the motion was that it asked for something to be done within twelve months, and it could never be accomplished in that time. An alternative scheme would be not merely a matter of money or of laying down a pattern of organization. It involved planning into the use of many resources which were in short supply. He asked the meeting to support the motion, but not to make it incumbent on Council to give a final report by next year.

Dr. H. C. W. BAKER (Council) said that there was already an alternative medical service in the Independent Medical Services. (Cries of "Poppycock.") An alternative medical service must be available so that if the N.H.S. broke down it would be there to offer to the public.

Dr. GIBSON said he had no objection to the motion. He supported it to the extent that the previous year he had asked Dr. I. M. Jones to set up the working party on the N.H.S., before the Association's Planning Unit had been set up. The only objection he had was the time limit. He asked for the withdrawal of the words "in 1968" from the motion. He was happy to accept it with the omission of those words.

Dr. MACLAY, in reply, said he wanted a new national health service which might run parallel with Independent Medical Services, to include all branches of medical care in the country as a whole. So far attempts at reform had been limited to amendments to the National Health Service on its present course. Doctors felt they needed a new and better service to give better care to all patients in the country and to give themselves a better and more satisfying career. He had to ask for some report within 12 months, because otherwise the subject would go on year after year. He understood the difficulties in devising a complete alternative national health service within a year, but some comprehensive report should be asked for within 12 months.

The Meeting agreed to the deletion of the words "in 1968" and the substitution therefor of "as soon as possible."

The motion, as amended, was carried.

The 100% Issue

Dr. J. G. FREEMAN HEAL (Brent) moved: "That the motion (Minute 88) carried by S.R.M. of May 1945 be now rescinded.

Minute 88 of the S.R.M. of May 1945 read as follows: "88. Proposed by the Chairman of Council: 'That the following recommendation of Council should be adopted. (E) That the Association, regarding the 100% issue as one for Parliament to decide, is willing to negotiate terms and conditions for such a 100% service, if such be decided upon, provided that ample safeguards are introduced to ensure that any member of the community, whatever his income, should be enabled to obtain his medical service, in part or in whole, privately, as, for example, by grant-in-aid provision.'"

Dr. Freeman Heal said that the proviso mentioned had been ignored by successive Governments and every Government had discouraged private practice. At the same time every Government had leaned heavily on the 100% agreement with the profession, offering the public a comprehensive health service free on demand. The anxiety of the Government on that point had been evident in the first conversations on the Charter, when the Minister had asked the negotiators if they still stood by the 100% commitment.

Since 1945 such changes had taken place in the circumstances in which the 100% commitment operated that the speculative optimism of the profession's decision of 1945 had become an imprudence of the first order in 1967. He submitted that at the present time it was a physical impossibility for the profession to sustain an adequate medical service for the whole community within the present statutes and regulations governing the N.H.S.

The seriousness of the situation was enhanced by the risk that at any time general practitioners with excessive lists might have numbers of additional patients allocated to them. This was a liability which flowed directly from the 100% commitment. The hospital service had shortages of staff, which meant closing some casualty departments, long waiting-lists for appointments and admissions, and borrowing 46% of the junior staff from overseas. Aggravating the situation was the increase in population.

Dr. Freeman Heal submitted that the principle of 100% responsibility remained an article of faith given by the profession even though it proved unrealizable in practice. It formed the basis of any reorganization of the National Health Service. It circumscribed the Planning Unit and constituted a restrictive barrier to the consideration of a possible alternative service. Finally, it was the reliance of the Ministry on the 100% commitment which enabled it to expose the profession to the insatiable demands of the public.

Forced on Profession

Dr. C. M. SCOTT (Council) said that, judging by the reception the Meeting had given to the Guildford motion instructing the Council to prepare an alternative Service, and the majority by which it had been passed, he had little doubt that representatives were still seeing the light they saw at Swansea. He hoped that the motion by Brent would be given the necessary two-thirds majority. The motion was a compromise one. The 100% issue was one on which doctors were split. The proviso that ample safeguards should be introduced to enable people to obtain their medical attention privately had never been honoured, and he doubted if it ever could have been honoured.

Dr. Scott said that the mover of the motion wanted present policy rescinded so that the Planning Unit could look ahead and be given room for manœuvre. When the National Health Service Bill was under discussion Dr. Wand had been one of the out-and-out opponents of the 100% principle. If the profession in 1945 had stuck to 90%, and had simply accepted the existing National Health Insurance scheme for everybody at what was an appropriate income level, there would have been little argument and no acrimony since, Dr. Scott declared. Approval of the 100% issue had been forced upon the profession.

However, there was now a new climate of opinion in all political parties that the social services had to be completely recast at an early date. The Meeting should have no doubt whatsoever in rescinding Minute 88 of the S.R.M. in 1945. The motion was simply an attempt to make the National Health Service viable by going back to something like the 90% issue, which he hoped the Planning Unit would urge.

Dr. A. V. RUSSELL (Council) said that he thought the 100% decision taken in 1945 a disastrous one, and one from which had stemmed many of the difficulties that bedevilled the profession today. He remembered Dr. Wand saying at the time that if the profession accepted the 100% decision instead of 90% it was sunk. How right his prophecies had turned out to be, said Dr. Russell. Minute 88 was now dead wood. "Let us cut it out and clear the way to a viable and healthy Health Service." The State was no longer capable of financing an adequate service to cover 100% of the population. It was quite obvious that more than 10% of the population wanted to make their own arrangements. The grant-in-aid provisions suggested in the 1945 decision had never been honoured.

Dr. RONALD GIBSON wondered what exactly the movers wanted. If to pass the motion merely meant that the Planning Unit should have more room for manœuvre he could not say he had any objection to it. But if it meant that the B.M.A. must go to the Minister to demand that the N.H.S. should no longer cover 100% of the population that might become a resignation issue. What did the mover mean ?

Dr. FREEMAN HEAL (Brent) said the idea behind the motion was simply to give the Planning Unit an opportunity to manœuvre. It was not a challenge to the Government and was not intended to be a resignation issue. Dr. GIBSON asked for an amendment to that effect, as he thought the words should be included.

Dr. D. V. CASHMAN (Tyneside) said that the significant thing about the motion was the date quoted in it—namely, 1945. That was over 20 years ago. The resolution may have seemed wise at that time, but increasing demands had been made upon doctors, and with an increasing population doctors were now unable to fulfil their duties satisfactorily and get list sizes down. Doctors could not provide a 100% service.

Dr. J. C. CAMERON (Chairman of the General Medical Services Committee) said that the implementation of the 100% obligation had given great concern in the under-doctored areas. He was in sympathy with the difficulties doctors were facing in providing a 100% service, and he would support a motion which was up to date. Everything possible must be done to improve the conditions of general practice and reduce the work load. The present suggestions were constructive, and both Government and Opposition were having a re-look at the social security legislation.

Battles of Yesteryear

Dr. R. B. L. RIDGE (Council) observed that the motion was being used by old soldiers to fight again the battles of yesteryear. The results of those battles had no relevance to the existing situation. "The fact," said Dr. Ridge, "is that the only people who can give medical services to patients are doctors." The 100% issue was wholly immaterial, because only doctors could treat the people, whether there were enough doctors or whether there were too many doctors.

The policy of the Association was inherent in its acceptance of the three joint reports. The penultimate paragraph of the third joint report put the issue in the right perspective, stating that the profession would continue to recognize the collective responsibility of National Health Service doctors to provide family doctor services for all members of the population who desired them. The paragraph continued: "The Ministers have the duty of ensuring the provision of the services, but they can only do so through doctors. If the collective responsibility of the profession is to be discharged the conditions of general practice must be such as to attract and retain sufficient doctors for the purpose and enable them to deploy their services to the best advantage, but this is not a matter in which the Ministers can act alone: it must be carried through jointly with the profession."

It was on that basis that Dr. Ridge hoped the Meeting would plan its policy for the future.

Dr. OUTWIN (Council) moved an amendment: "That this Representative Body is prepared to support the resolution of Council that the profession can no longer accept collective responsibility for the preservation of a standard of medical care which a modern community should expect under the National Health Service.

He said that the Representative Body found itself in a difficult position on the Brent motion. He was sure everybody would support the fundamental principle. At the same time if it was possible it would merely be an attempt to remedy the past rather than to do anything constructive for the future. The matter was being left wide open for future negotiating committees to produce alternative schemes. If the matter was put forward in such a way the public might get

Mr. J. Angell James (left), chairman of the Bristol Division, and Mrs. Angell James welcome Mr. Robert V. Cooke, President Elect, at a reception to welcome delegates held at the University Great Hall on Wednesday, 5 July.

the wrong impression. To the credit of Council, it had passed a motion a month ago in the same terms as the proposed amendment. It was not suggested that 10% of the population should be refused treatment under the Health Service, although it was difficult to see how the 10% would be selected. The 100% issue could be very difficult to interpret and very easily misinterpreted.

Dr. I. M. **Jones** (Council) formally seconded Dr. Outwin's amendment.

Dr. A. **Elliott** (Redbridge) opposed the amendment. It would be very undiplomatic to pass it. The G.M.S. Committee was already on record as asking for an independent inquiry into the Health Service. In his view neither the resolution nor the amendment was necessary in those circumstances.

Dr. C. P. **Wallace** (Guildford) hoped the Meeting would accept the amendment as a reasonable and common-sense compromise. With respect, he disagreed with what the Chairman of Council had said. Although at one juncture the profession had had to accept the 100% issue, that did not mean that if the motion before the meeting was passed the profession would be forced to make the substance of it a resignation issue. The choice of what was a resignation issue lay with the Representative Body. There was anxiety about the standard of medical care in the country. Because of the brandishing of the 100% idea for political purposes, standards of care would suffer. When the time came doctors would be prepared to make the matter a resignation issue, but the time had not come and no one had suggested that it had.

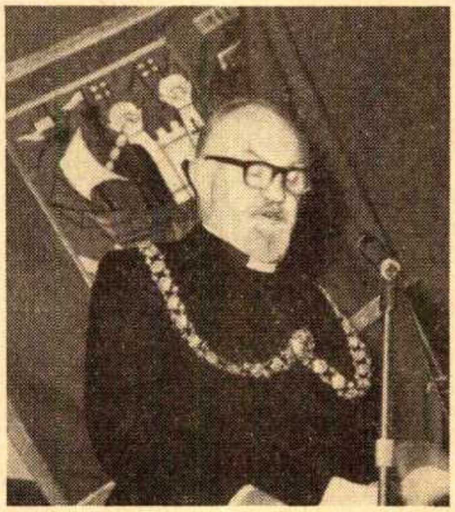
Dr. I. M. **Jones** (Council) said he had seconded the amendment for the very good reason that his opinion on the matter was supported by no less a person that a former Minister of Health, Mr. Enoch Powell, who had set out his views in a recent book on the problem of medicine and politics. Dr. Jones said Mr. Powell had stated that the existing Health Service did not enable a proper standard of medical care to be given to the public, imprisoned as the N.H.S. was by political considerations.

Accepted Duty

Dr. G. **Cormack** (Newcastle upon Tyne) said that it should be clear that what the amendment suggested was not that the medical profession was unable to provide medical care for 100% of the community. It had always been the honour, privilege, and cheerfully accepted duty of the medical profession to care for 100% of the population, and he was sure doctors would continue to shoulder that responsibility, no matter how the medical services were organized. The amendment stated that it was impracticable to provide 100% medical care under the present organization of the National Health Service, and under the present system of obtaining money mainly through taxation. Dr. Cormack thought that that was a statement of fact which should be obvious. Taxation could not provide the essential funds, and it was therefore only common sense that an alternative means of providing money should be available.

Dr. R. L. **Luffingham** (Council) said that in his and in other designated areas the number of doctors continued to fall. The Minister had said that anything the patient asked for he ought to have. What the profession was saying was that it was absolutely essential for medical care to be provided. When the average list had risen in five years from 2,400 to 2,800 it could no longer be said that doctors could provide a proper service. Therefore the profession was giving fair warning that, however hard it tried, whatever system it used, it could not provide adequate medical care on the 100% basis in the present circumstances.

Dr. S. **Freeman** (Manchester) thought the matter a simple one. As members of the medical profession they had to look after 100% of the community. If the motion was passed they were saying that they could not look after 100% of the population under the National Health Service but were prepared to do it if a section of the population were private patients. He concluded, "This, I think, is diabolical."



The Lord Mayor of Bristol, Alderman the Reverend F. C. Vyvyan-Jones, welcoming the delegates to Bristol.

Dr. **Freeman Heal** (Brent) said that his Division's original motion was straightforward. The amendment carried with it more implications of the subject becoming a resignation issue than the Brent motion, which was merely to rescind an agreement which had proved impossible to implement. If that were passed it did not present a resignation issue, whereas the amendment certainly did.

Dr. **Outwin** (Council) pointed out that the profession was not abrogating its responsibility to the community in any way. It was shouldering the responsibility of indicating sooner than later that it could not carry out its duties satisfactorily in the Health Service as it was organized at present.

The amendment, "That this Representative Body is prepared to support the resolution of Council that the profession can no longer accept collective responsibility for the preservation of a standard of medical care which a modern community should expect under the Health Service," was carried.

A motion to pass to next business was not carried by the necessary majority.

The amendment was carried as the substantive motion by the necessary majority.

Renal Dialysis

Dr. R. G. **Troup** (Havering) moved: "That this Meeting recommends that the matter of the supply and demand of renal dialysis machines should be considered under paragraph (vi) of the terms of reference of the Planning Committee."

He said he understood that 7,000 people died every year from renal failure. That was a matter of public concern, and the profession had to take steps to advise the public and the Ministry on the best use of dialysing equipment. His Division thought that a study of the need for the supply of renal dialysis machines was a matter for the Planning Unit.

The motion was carried as a reference to Council.

Health Centres

Dr. C. C. **Lutton** (East and Midlothian) moved: "That the Planning Unit should investigate the potential of medical services from health centres as a matter of urgency and make a report."

He said that health centres were being planned now. The Minister of Health had shown his enthusiasm for them. The number of 300 health centres being planned was itself rapidly being overtaken by more planning. There might well be more than 100 functioning within three years in England and Wales and four or five times that number within 10 years. The Minister had spoken of the increasing interest in health centres by the profession. Did the Minister want the profession to enter a room and he would then turn the key behind them?

The potential of health centres should be anticipated and planned by the profession. What was its policy on health centres? Were health centres needed? If so, why? If not, why not? Were there any alternatives for the future? Would general practice from health centres be the only way? If the profession failed to make the framework it would be in the power of the Ministry.

Dr. J. S. **Ross** (Council) said that there was no doubt that in certain areas health centres were desirable. There was scope for them in developing areas. In densely populated districts where surgery facilities were poor redevelopment offered an opportunity for health centres, particularly where the cost of land was prohibitive. However, the matter had to be considered carefully. The Planning Unit was the right unit to look at the problem, both from the professional and from the public points of view.

Dr. **Ross** said he was particularly concerned about general practice in health centres. The Government was offering every blandishment for doctors to work in them. There would soon be a headlong rush into them without considering the consequences. He feared, as a result of overwork and disillusion, doctors were becoming conditioned to the thought of an easier life and working from nine to five, but was this the sort of life they really wanted? They would be selling their freedom if they worked in these local authority premises and would never be able to resign from the National Health Service. If health-centre development became extensive they would soon be a salaried service.

With improvement grants doctors had means to provide a better service to patients, and to organize their practices properly in their own premises without sacrificing their freedom.

An amendment to add the words at the end of the motion, "and group practices and medical centres," was carried.

Dr. A. Elliott (Redbridge) opposed the motion, while agreeing that security of tenure and professional freedom of doctors in health centres had to be safeguarded. The working party of the G.M.S. Committee was looking into the whole question of health centres. He did not think that there should be several committees in the Association doing the same thing.

Dr. Ronald Gibson said that he had no objection to the motion, and he was well aware of the need to be prepared for practising in health centres. However, he was concerned that the matter was already being examined by the G.M.S. Committee, and he feared that if care was not taken the Planning Unit might end up by taking on more than it could cope with.

A motion, "That the question be now put," was moved and carried by the necessary majority.

Dr. Lutton, in reply, wondered whether the number of general practitioners who wished to go into health centres had ever been assessed. Doctors other than general practitioners were involved. Public health doctors were very interested in view of the changes in public health legislation.

The motion, as amended, was carried.

Developments in Science

Dr. E. E. Claxton (Dartford) moved a motion congratulating the Council on the concept of a planning unit and urging the unit to take cognizance of the effect on society of modern developments in science.

He said that Dartford wanted the Council to consider the rôle of medicine in a changing society and social causes of disease in modern life. The kernel of the matter was the future of the profession. Would it develop further as a responsible vocation or become a mere technology? In a rapidly changing world medicine, which represented both science and compassion, could be a stabilizing influence for mankind. His Division hoped that the Planning Unit would produce constructive ideas for the profession's share in the development of a healthy world.

As a profession, doctors should ask themselves where they were going? What were they doing? Was it enough to diagnose, to treat, or to prevent disease? Ought they not to discover a new and more radical aim? Ought they not to widen the scope of preventive and social medicine so that they were part of normal practice? Should not health education embrace the art of human relationships and communications? He believed the profession had a role to point and to pattern a way for mankind. It was for the Planning Unit to prepare the blueprint and for the profession to carry it into effect.

A motion that the question be now put was carried by the necessary majority, and, on being put to the meeting, the motion was approved.

Regional Organization

Dr. W. D. Gray (Liverpool) moved: "That this A.R.M. is opposed to the proposed regional office reorganization of the B.M.A."

He said that the Liverpool Division and other Divisions on Merseyside were now served by an excellent regional office in the new buildings of the Liverpool Medical Institution. Notices for meetings, letters, minutes, and all other business connected with the Divisions, the regional consultants and specialists committee, and other groups could easily be transacted through this office. The service had been available for these Divisions for many years. The Liverpool Division considered that it would be a retrograde step if the regional office in Liverpool became a mere post office, sending all work to be done to Manchester.

Dr. Gray said that the assurances received from Headquarters had been insufficient to satisfy his Division that the services to be provided under the new scheme would be as good as those provided under the old.

Dr. C. J. Wells (Sheffield) said the motion from his Division was slightly different from that of Liverpool. Sheffield wanted efficiently maintained regional offices.

Dr. H. Glyn Jones (Bromley) said he supported the motion not so much as a Divisional representative but because he was a member of a regional consultants and specialists committee. Regional consultants and specialists committees, unlike local medical committees, had no means of raising funds. They were therefore dependent on the Association for clerical services. In those areas where there were regional offices these committees were generally provided with a committee clerk and facilities. This was also the case in the Metropolitan regions. There was now a proposal to reduce the number of regional offices, and the services of the committee clerk which had been provided for the South-east Metropolitan Regional Committee were now being withdrawn.

Progress or No Progress

Dr. Gibson described the debate as "crucial." The choice was progress or no progress. Was it to be today's machine or yesterday's? There could be no question in his mind, from the visits he had made throughout the country, that the new regional offices were vital. What was needed was an active unit in the regions to do the work—in other words, decentralization.

Dr. S. Wand (Treasurer) said he wanted to say something about costs. To continue the existing organization would cost £50,000 a year. The proposals which had been outlined by the Chairman of Council would provide a medical secretary for certain areas. Some of the regional offices would remain in other areas. This would cost £75,000 a year. Last year Dr. Wand said that he told the Representative Body that the proposed new regional offices were a priority, and the money would have to be found even if something else had to go by the board. If all the present offices were retained as well as the new regional offices with their medical secretaries it would increase the cost by probably £15,000. That was a lot of money.

Replying to the debate, Dr. Gray said he was not entirely convinced by the arguments advanced against the motion. He agreed that regions needed the facilities described, but he did not think a regional medical secretary was going to fulfil all that was required.

The motion was defeated.

Dr. M. J. Forth (Somerset) asked permission to withdraw a motion standing in the name of Somerset: "That a main regional office should be maintained at Bristol."

He said that since the Division had put forward the motion it had learned that the Bristol office would stay much as it was, except that mailing would be done from London, and, in addition, it would have the services of a medical secretary. This fully met Bristol's requirements, and the motion became pointless. Dr. Forth paid tribute to Miss J. E. Ring, the regional officer for the West of England.

The motion was, by leave, withdrawn.

A motion by the Chairman of Council: "That the remainder of the Annual Report of Council under 'Preliminary' be approved," was carried.

Public Health

Dr. C. Metcalfe Brown (Chairman of the Public Health Committee) moved on behalf of the Council: "That the Annual Report of Council under 'Public Health,' paragraphs 106–122, Evidence to Royal Commission (Appendix V), Evidence to Seebohm Committee (Appendix VI), and Evidence to G.M.C. on Revision of Rules for Diploma in Public Health (Appendix VII), be received."

Dr. Brown said he wished to give the Representative Body some idea of the history of the present dispute on the pay of public health medical officers. In 1950 Whitley

Part of the Assembly in the Anson Room of the University Union listening to the Lord Mayor's welcome.

Committee C had been set up, a committee independent of any other Whitley Council, to deal with the salaries of public health medical officers. Since then the Management Side had persisted in trying to relate the remuneration of medical officers to that of other officers in local government service. The medical officers in the public health service had insisted that they wished to be paid on the same basis as other doctors. So far the Management Side view had prevailed, even so far as the Industrial Court was concerned, but time and time again the public health medical officers had persisted in their view.

Dr. Brown said that the pay for the commencing grade for a career in the public health service was £1,500 per annum. That alone illustrated the extraordinary hardships suffered by doctors in the public health service. It was against the interests of the public and of the profession that such a state of affairs should continue. Dr. Brown said he was glad that the Council had received the representations of the Public Health Committee with the greatest of sympathy, and had resolved unanimously that the public health service should have its full support. There had also been strong support from Divisions.

The Minister of Health at the time of the Royal Commission had assured the B.M.A. that the relationship of public health medical officers to other doctors would be taken into account in future negotiations. But the Management Side had still persisted in equating doctors with non-medical officers in the local authority service. So long ago as last June the Public Health Committee, with the approval of the Council, had put forward a reasonable claim. There had not been a word of formal reply to the claim from the Management Side, though over a year had passed. This action by the Management Side was, in his view, a gross avoidance of its obligations, and amounted to a great injustice. That had been the main reason why the Council had been asked to apply sanctions, which it had willingly done. He hoped that the Representative Body would support the Council. There would be no relaxation of pressure until the Management Side produced what the Council agreed was a firm acceptable offer.

Dr. Brown then discussed superannuation. The question of "added years" was a perennial one, he said. Local councils had the power to permit "added years" for a certain small section of public health medical officers. Some councils did so and some did not. The Council of the B.M.A. was applying pressure on the appropriate Ministries.

Local Government Services

The thread of the Association's memorandum submitted to the Royal Commission on Local Government in England was that in any rearrangement of local government areas in the future there should be much larger local authorities. This would be valuable not only from the point of view of providing the best services, medical and otherwise, but also because it provided a suitable background for the reorganization of the medical services.

An important problem had arisen as a result of the publication of a White Paper on the reorganization of the social services in Scotland. The White Paper suggested that there should be a combination of social services, and that was in accordance with the policy of the Association, but it then went further and said that the social services should not be under the control of the medical officer of health. If social workers were going to run the combined services, including the medical social services, it would mean that the social workers would be in charge of the local authority health services, and doctors would do no more than provide the necessary medical information. But medical provision in all the social services was so important that the B.M.A. could not agree with these proposals, and that view had been put to the Seebohm Committee.

Dr. Brown then discussed fluoridation. In his view any authority which failed to provide fluoridation in relation to the water supply was depriving children of good dental health, which they should have and would have where fluoridation schemes had been adopted. The policy of the Association was to get the Government to take central action. He hoped, however, that action would be taken locally so far as possible.

Mrs. Angell James presenting a banner to the Association during the welcome ceremony in the Anson Room at the University Union.

Dr. Brown reviewed the other work of the Public Health Committee described in the Annual Report of Council, including notifiable diseases, food hygiene, and the contamination of bathing beaches. He said that it was the policy of the Association that there should be provision of free milk in schools.

At this point it was moved, seconded, and carried that speeches should be limited to three minutes for movers of motions and two minutes for others.

Remuneration of Public Health Doctors

Dr. N. G. **Nicholson** (South Middlesex) moved: "That this Meeting considers that doctors in the local government service should have the same financial recognition as those in the armed Forces, where the precedent is already established that medical officers are paid at a higher rate than other officers of equivalent rank."

He said that the motion went to the root of the trouble between the local authorities as employers and the doctors working for them. The administration was afraid that if the pay of the local authority doctors was increased, to bring them in line with other doctors in the Health Service, it would create an imbalance in the local government service. His Division maintained that the principle had already been established. Doctors were paid more than any other officers of equivalent rank in the Army, Navy, and Royal Air Force. The Services recognized that doctors had to have long years of training before they received their commission, and that they were the most highly specialized branch. He asked the Meeting to pass the motion unanimously.

Dr. J. H. **Marks** (Barnet) said that, while agreeing with the desire to raise the financial status of local authority doctors, he opposed the motion, because to accept it would extend an undesirable system. Many service medical officers remembered the bitterness expressed by others, particularly technical officers, about the fact that the doctors' rates of pay were higher than theirs. He did not wish to see that extended to the local authority services. The Representative Body should insist that the pay of all doctors employed in all branches of the National Health Service should be related only to the pay of other doctors, and that these rates should be fixed by the Review Body.

Dr. **Harvey Gordon** (Council) said the Meeting should not get involved with the rates of pay of other staff. He asked the Meeting to vote against the motion.

Dr. **Metcalfe Brown** said the motion expressed sympathy and support for the dilemma the public authority medical officers were in, but the opposers had clearly indicated the best reason why it should not be accepted.

The motion was lost.

Deputies

Dr. R. C. **Greenberg** (Finchley) moved: "That in spite of the differential proposed in the salary claim for deputy medical officers of health, specialist medical officers should not be precluded from receiving remuneration commensurate with exceptional merit."

He said that the motion arose out of what had been B.M.A. policy and was in accordance with the claim, which said, "A deputy medical officer of health shall receive a salary in accordance with the scale of three-quarters of his chief, subject to the fact that his maximum should be £50 more than subordinate medical grades."

This policy acted in a reverse way. Instead of protecting the interests of deputies it degraded the status of distinguished physicians in the service. Some of the specialists who were dealt with under the heading of "subordinate medical grades" might be distinguished doctors who by specializing had been prevented from moving into higher-paid posts. Some of those in the mental health service were running within the public health service a clinical service equivalent to that of hospital psychiatrists. They were denied the appropriate fianancial recognition, and the present policy, if the motion was not passed, would continue to deny it them.

Dr. **Metcalfe Brown** said that the differential between a deputy medical officer of health and other members of the staff had existed for many years. He had found it invaluable in protecting medical officers rather than damaging them, and, he asked, who was to judge what was to be exceptional merit? On the other hand, it was a matter worth investigating, and he suggested the motion should be referred to the Council.

Dr. GREENBERG agreed that the situation had existed for years, but what the public health service had not recognized was that the clinical patterns of practice had changed. He was asking for a safety valve.

The motion was lost.

A number of agreed motions urging that support be given for obtaining a satisfactory level of remuneration for public health medical officers comparable with the other branches of the profession was accepted.

Off-duty Work

Mr. R. K. ALLDAY (Holland) moved: "That this Meeting considers that the conditions of service of public health medical officers which prohibit occasional work in the hospital and general-practice fields, and payment therefor, are unnecessarily restrictive and contrary to the national interests. While recognizing that no full-time public health medical officer should act as a principal in private or N.H.S. general practice, this Meeting urges negotiation to alter paragraphs 4 and 5 of section P of the Whitley Conditions of service to permit paid work out of office hours."

He said that medical officers of health and assistant medical officers of health, to whom the motion chiefly applied, should have the right to engage in other forms of medical practice which did not conflict with their duties as medical officers of health. One way of achieving this would be for medical officers of health to do occasional work in hospital and general practice. That was not at present excluded, provided permission was obtained from the authority, but that was not always easy to get. Furthermore any pay so obtained went to the employing Council. If a public health medical officer wished to engage in an occupation beneficial to him, to the National Health Service, and to his colleagues it seemed unjust that he should be penalized for so doing.

Dr. G. N. MARSH (Stockton) pointed out that, with general practitioners moving more and more into groups and shared premises, it would be a natural development for medical officers of health and assistant medical officers of health to find their work shifting towards group-practice centres. They should be able to play a recognized part in them. They could provide administrative and epidemiological knowledge. Any restrictive practice clauses which prevented closer integration of public health medical officers into the field of general practice were out of date.

Dr. A. W. MACARA (Junior Members' Forum) thought that to pass the motion at the present time would suggest that public health medical officers did not have enough to do. That might embarrass the negotiators.

Dr. METCALFE BROWN agreed with Dr. Macara. It would be unwise to introduce a new difficulty into the negotiations.

Mr. R. K. ALLDAY (Holland) thought that many assistant medical officers of health and medical officers of health were far too busy to engage in general or hospital practice, but that did not mean they all were. There were junior doctors in the public health service who wished to employ their leisure time in general and hospital practice.

The motion was carried.

A motion standing in the name of Portsmouth: That the Association continues to press for remedy of the haphazard situation which prevents public health medical officers obtaining a full pension," was accepted.

Royal Commission on Local Government

Dr. W. FERGUSON (E. Yorkshire) moved: "That in view of the brevity, lack of detailed argument, and positive proposals in the Association's memorandum to Royal Commission on Local Government, as detailed in Appendix V, Annual Report of Council, the Council be instructed to prepare and submit a supplementary memorandum, without delay."

He said that changes in the structure of local government would result in a major reorganization of local health authorities and social services. Despite the importance of the Royal Commission, the Association's evidence was brief, and practically the only positive suggestion in it was that local authorities should become larger still. There was no suggestion about the maximum or minimum size of the local government unit which would be suitable for health-service purposes. It did not necessarily follow that because a local government unit became larger it became more efficient. No suggestions were made on how the larger units would affect the two-tier system in county areas or the future functions of medical officers of health. No mention was made of the effect on local council areas or local medical committees. In rural areas general practitioners might find themselves having to travel much further to executive council meetings.

He questioned the statement in the document that larger units of administration would facilitate arrangements for final school-leaving medical examinations. In larger units of local government the school health service had been decentralized in order to make it work. He questioned whether the maintenance of uniform standards in housing was ensured if the administrative unit covered a wide area. Adequate standards were desirable but not uniform standards. He also questioned whether the administration of environmental health control by larger authorities would raise and maintain standards, or that the larger unit would provide a better ambulance service.

Dr. METCALFE BROWN said that most people with whom he had discussed the subject thought large areas were essential to provide a background not only for better services but against which to develop an improved, unified medical service. To say there was no virtue in uniformity in relation to housing was untrue. In his area he could see one standard in one place and one in another, and the Ministry was at present spending its time sending neutral inspectors round various areas to try to establish uniformity. Without uniformity there would not be correct standards in many areas.

Dr. FERGUSON, in reply, said he was not quibbling with the fact that larger units were required in many areas but because the document gave no guidance on what the size should be. Adequacy and uniformity did not necessarily go together.

The motion was lost.

Social Work and the Community

Dr. L. P. GRIME (Junior Members Forum) moved: "That this Meeting believes that it is in the best interests of the medical profession as a whole, and their patients, that the medical–social services provided by local authorities—as, for example, mental health, care and aftercare of the sick, and the care of the physically handicapped and of the aged—remain under medical direction and be not transferred to non-medical control."

He said that it was clear that it was the Government's intention to transfer to lay administrators the mental health services, the care and aftercare of the sick and physically handicapped, and various other services run by local health authorities. These services were better orientated under medical control.

Dr. K. A. WOOD (Portsmouth) supported the motions.

Dr. J. M. DUNLOP (Public Health Committee) said that feelings in Scotland were strong about this. The White Paper, "Social Work and the Community," applied to Scotland alone. A lay administrator would not be privy to the essential confidential details which a medical officer of health received from medical colleagues.

Dr. DORIS M. ODLUM (Bournemouth) said that as a psychiatrist she had no doubt that it would be fatal to divorce the medical and social services for the mentally handicapped, the aged, and the physically handicapped from medical control. It would be a completely retrograde step. There was no subject of more medical interest and more complex than mental health and mental health of the aged, which was becoming more and more a problem in the community.

Dr. D. R. COOK (Camden) said that the dangers envisaged had already come to pass. In one of the London local boroughs it had been decided to make a joint appointment of a social worker between the hospital and the local authority. It had then been discovered that this joint appointment would be between the hospital on the one side and the welfare department of the local authority on the other —with no medical supervision whatever of the medical social workers in their out-of-hospital activities.

Dr. METCALFE BROWN accepted everything that had been said. The position was very serious indeed, he said.

The motion was carried.

The following motions were accepted:

"That this Meeting notes with concern that many local authorities have not yet implemented the valuable preventive health measures of fluoridating the water supplies and urges all such authorities to review the situation immediately." (Kingston-upon-Thames.)

"That this Meeting considers that the list of notifiable diseases and the information required on the notification form should be reviewed." (Waltham Forest.)

"That great care should be taken that any advice in the form of health education given to the public is practical and supported by substantial evidence of its value. Resources must not be wasted and the public image of the medical profession harmed by advice which may later be shown to be insupportable" (East Herts.)

Contamination of Bathing Beaches

Dr. R. COVE-SMITH (St. Marylebone) moved: "That this Meeting recommends that sewage of seaside resorts and towns should be 'treated' in the same way as that of inland towns."

He pointed out that, while there were certain regulations about the quantity and quality of effluents put into rivers, there was none on the control of the effluent put into the sea. Most local authorities were concerned that sewage should be discharged at a safe position and that natural breakdown should occur. But there were difficulties about this and no method of treatment had so far been adequately established. One local authority was working out an electrolytic form of treatment which would be reasonably cheap. He hoped it would be acceptable to most authorities without undue expenditure.

Mr. A. LAWRENCE ABEL (St. Marylebone) asked what was the good of advising people to wash their hands after going to the lavatory when it was quite in order for them to bathe in sewage-polluted waters? It took a long time to sterilize effluents by exposure to the sun and by dilution. Seaside towns should have their disposal of sewage modernized, especially in view of the rapidly increasing population.

The motion was carried.

Free Milk in Schools

Dr. G. D. H. SHEPHARD (Gloucestershire) moved: "That this Meeting recommends that the issue of free milk to schoolchildren should be discontinued at the age of 11, except in cases of medical necessity."

He said that no one would deny the tremendous benefits the school milk system had had on the health of the growing children. Did the scheme now do what it was intended to do when it was first brought out? asked Dr. Shephard. The health of the community had improved, and he doubted whether many of the children who were getting school milk needed it. At the age of 5, when the child first went to school, it was easy to ensure a 100% distribution and consumption of milk. That was desirable as a health measure, and it was a good thing to teach the children the habit of drinking milk. But apparently when children got to the age of 11 they were asked at the beginning of the term by a teacher to hold up their hands if they wanted milk. Some did and were counted. For the rest of that term that number of bottles of milk were provided and only the children who had asked for the milk got it. That did not mean, however, that those children who really needed the milk got it. The B.M.A. should be able to examine this subject in an unbiased way. It should pronounce clearly without fear or favour on all matters with a medical aspect.

Dr. J. S. HAPPEL (Winchester) moved as an amendment, "That this Meeting recommends that the issue of free milk to schoolchildren should be discontinued, except in cases of medical necessity."

In Government grants to county councils and boroughs from 1 April 1967 the specific grants to cover free milk had ceased and were simply taken into account in fixing the general grant. So central Government was not so convinced of the need for the scheme. Free milk ought to take its place with other priorities. Winchester believed that there should be a drastic pruning of the whole scheme.

Dr. METCALFE BROWN described the subject as a matter of great importance. So far as he could see there seemed to be disapproval on the part of doctors who came from the more prosperous areas of the south. Those doctors, however, forgot the real problems in the Midlands and in the north in relation to nutrition. He drew attention to a recent article which said that there were some 630,000 in the low-income-group families who did not get enough food for optimum development. Milk was just one of the foods that were required. Children who wanted free milk could get it. No one forced them to take it. There were week-ends and holidays, and in practice the children who took milk got one-quarter of a pint a day. Was that going to make them fat?

The Winchester amendment was declared lost.

Dr. B. TAYLOR (Tower Hamlets) moved as a further amendment, "That after the word 'meeting' the following be inserted, 'being of the opinion that supplementary milk supplies are no longer necessary for the nutrition of the population of this country.'"

Deprived Children

Dr. Taylor said that he represented one of the poorer districts of London. His Division thought the Gloucestershire motion might cause the public to think, "Those wicked doctors are trying to deprive our children of their nourishment."

Dr. WALLACE (Guildford) hoped that the Representative Meeting would hesitate to pass any resolution which would urge that the supply of milk to the children should be discontinued. Dr. J. L. MCCALLUM (Westminster and Holborn) supported Dr. Wallace, and said that the amendment was disgraceful. He hoped the meeting would throw it out at once.

Dr. METCALFE BROWN reminded the Meeting that the Council did not favour any change in the existing arrangements for the provision of free milk.

The amendment was lost.

Dr. H. M. COHEN (Birmingham) hoped the meeting would reject the motion and referred to a report entitled "Malnutrition in the 1960s," which said, "In the area between chronic deficiency and optimum health more is known about animals than about men." The point he would emphasize was that there was optimum health. Only the day before the Ministry of Social Security had drawn attention to the fact that 1¼ million children belonged to families where the income was below the basic requirement.

The motion, "That the question be now put" was agreed to.

The motion was carried.

Constitution of Public Health Committee

Dr. C. METCALFE BROWN moved: "That the constitution of the Public Health Committee be amended so that the Public Health Committee (Scotland) appoints two representatives to the Public Health Committee, and the Society of Medical Officers of Health includes one representative from Scotland among its seven appointees to the Public Health Committee, and that there be no separate regional representation from Scotland."

Dr. J. M. DUNLOP (Public Health Committee) moved the following amendment: That the word "three" be substituted for "two."

Dr. Dunlop said that in an attempt to show more democracy it had been agreed that every regional public health committee in Britain was entitled to one seat on the Public Health Committee, apart from London, which, owing to its size should get two. Scotland with five regional public health committees was therefore entitled to five seats. Scotland agreed that would be over-representation, but thought the recommended number of two seats was too small and wished to have three seats.

Dr. METCALFE BROWN stated that the recommendation had been carefully considered by Council, and said he would leave the decision to the Representative Body.

Dr. S. WAND (Treasurer) opposed the amendment. There were too many committees of too big a size already. Indeed, a Scottish Public Health Committee existed to deal with Scotland. He urged the Meeting to reject the amendment.

The amendment was lost.

The motion was carried by the necessary majority.

On the motion of Dr. METCALFE BROWN, the remainder of the Annual Report of Council under "Public Health" was approved.

Immigrants

A motion by Thames Valley, "That this Meeting is disturbed by the absence of any arrangements for the medical screening of the dependants of immigrants, and requests that urgent representations be made to the Government to take appropriate steps," was carried.

Chiropody Treatment

A motion by Tower Hamlets, "That this Meeting considers that chiropody treatment should be an integral part of the National Health Service and that measures should be taken by the Ministry of Health to implement this," was carried.

School-crossing Patrol Staff

Dr. H. GORDON (Council) moved: "That this Meeting urges the appropriate authorities to institute medical screening (at least a check on visual capabilities) of school-crossing patrol staff."

Dr. Gordon drew attention to the possible dangers of employing crossing patrol staff with defective vision or other physical disabilities. No medical examination was mandatory before men and women were given the jobs. It was desirable that these people, who were directing others on the roads in this country and also looking after the children of the community, should be subjected to some form of screening.

The motion was carried.

Constitution of Central Consultants and Specialists Committee

Mr. J. R. BLACKBURNE (Central Consultants and Specialists Committee) moved:

(i) That the number of seats on the Committee allocated to the Hospital Junior Staffs Group Executive Committee be increased from 4 to 12, one to be filled by the Chairman of the Hospital Junior Staffs Group Council (Scotland) and another to be filled by a member of the Hospital Junior Staffs Group Council (Scotland) nominated by the Central Consultants and Specialists Committee (Scotland).

(ii) That the number of seats on the Committee allocated to the Central Consultants and Specialists Committee (Scotland) be reduced from 10 to five.

(iii) That the five seats allocated to "part-time specialists" be abolished.

(iv) That the four seats filled by the Representative Body be reduced to three, two to be elected by Representatives of Constituencies in England and Wales and one by Representatives of Constituencies in Scotland.

(v) That the number of seats allocated to the S.H.M.O.s Group Committee be reduced from two to one

(vi) That a seat be allocated to a medical assistant, to be elected by a method to be determined.

(vii) That the following clause in the Schedule to the By-laws be rescinded in relation to the Deputy Chairman only:

> "The person or body entitled to appoint a representative to the Committee shall be entitled to appoint an additional representative to be a member of the Committee during any period for which a representative appointed by such persons or body shall hold office as Chairman or Deputy Chairman of the Committee."

(viii) That the seat allocated to a representative of the Occupational Health Committee be abolished.

(ix) That the observer from the Central Dental Consultants and Specialists Committee be admitted as a full member."

Mr. Blackburne said the object of the motion was to try to comply with the request of the Council to the C.C. and S. Committee and other committees that they should look at their structures and see whether they could streamline themselves and make the committees smaller, and also—something the C.C. and S. Committee had already decided to do—to increase the representation of the junior staffs.

The first proposal was to increase the number of junior staff from 4 to 12. The Committee was in full agreement with that, and believed it was also the wish of the Representative Body.

The second proposal was to reduce the number of seats of the Scottish Committee from 10 to 5, about which the C.C. and S. Committee had been a little unhappy. All sections had been asked to look for places where reductions could be made. The Scottish representatives generously had agreed that they would cut down their representation in the hope that other sections would do the same. Since then it had emerged that the seats allocated to the special groups could not be cut in number, which meant that the sacrifice the Scottish Committee had made was not being followed by other sections. It was only fair to say that in his view, and he believed in the view of the Scots themselves, they were adequately represented. Under the new proposals there would be 12 representatives from Scotland out of an average of between 80 and 90, which was rather more than the one-in-eight representation. Mr. Blackburne therefore hoped the Scottish representatives would be prepared to carry on with the reduction to which they had originally agreed.

The third proposal was to abolish the five seats allocated to part-time specialists, since the seats had not been filled for some years. The fourth proposal was to cut down the number of representatives elected by the Representative Body from four to three. This would be the Northern Ireland seat, as there were already two Northern Ireland representatives on the Central Consultants and Specialists Committee. The fifth proposal was to reduce the number of seats allocated to the S.H.M.O. Group Committee from two to one. The S.H.M.O. Group was diminishing as a large number of S.H.M.O.s were made consultants and some were made medical assistants. No more appointments would be made. The extra seat might be allocated to the new group of medical assistants, which was the sixth proposal.

The seventh proposal, that the seats allocated to deputy chairmen should be out of the regional representation, would save another two seats. Next, it had been felt the seat allocated to the Occupational Health Committee could be abolished, to which the Occupational Health Committee had itself agreed. The final proposal was that the observer from the Central Dental Consultants and Specialists Committee should be admitted as a full member.

It had not been possible to make as complete a reduction as had been hoped, but those reductions proposed were reasonable and would, Mr. Blackburne hoped, receive the Meeting's approval.

The motion was carried.

Title of Committee

Mr. BLACKBURNE then moved: "That the title of the Central Consultants and Specialists Committee be changed to 'The Central Committee for Hospital Medical Services,' and that the regional consultants and specialists committees be styled 'The . . . Regional Committee for Hospital Medical Services.'"

Mr. Blackburne said that originally the Central Consultants and Specialists Committee had represented largely the senior members of the hospital staff, but in recent years it had done more and more representation of the junior staff, and, it was hoped, would now represent the whole of the hospital services. The suggested change of title was therefore proposed.

The motion was carried.

General Medical Services

Dr. A. M. MAIDEN took the Chair.

Dr. J. C. CAMERON (Chairman of the G.M.S. Committee) moved: "That the Annual Report of Council under 'General Medical Services' be received."

He said that the year had been one of the most trying that the Committee had experienced. He would not wish to go through the last 18 months again. A year ago the profession had been given just about enough in the Review Body's award and in the three joint reports to enable doctors to start remedying the ills of general practice. "As a result of the economic climate we had to accept phasing, freezing, and, worst of all, having to watch the continuing deterioration in our manpower and work load," he said. It had not been easy for any doctor in practice. It had been only the mild winter which had enabled them to pull through. Now, and only now, could doctors see what the Review Body had really intended. Representatives must not forget that in the first whole year of the two-year period for which the Review Body had made its recommendations doctors had received a quarter of what had been intended—they had lost £18m.

The Review Body had deliberately made an award favouring general practice, where it had seen the greatest need to encourage recruitment. Yet, though general practitioners were supposed to have the greatest award, the economic restrictions had caused them to receive only a quarter of their award. Hospital doctors had received twice as much. Thus the Government had completely reversed the differential proposals of the Review Body.

Dr. Cameron continued: "We shall bring all this to the notice of the Review Body and quote the very simple figures which show that the number of general practitioners has still failed to keep up with the increase in the population. In fact only in the last three months has there been any slowing up at all in the rate of deterioration of our manpower situation." So much, then, for those who said said that remuneration was not the real problem. But doctors must never forget that it was as important to improve the conditions of general practice. Without improvement of recruitment all the labours would be in vain. Family doctors had a responsibility to encourage young doctors to enter general practice.

During the year the General Medical Services Committee had had to undertake a difficult and detailed task. The translation of the recommendations of the Review Body and of the three reports into practical form had required long negotiation and consultation with experts in the various fields, leading to careful scrutiny and approved by the Committee. In a few instances iniquities and anomalies had appeared in the course of practical application, Dr. Cameron went on. The Committee had tackled them immediately, and he was glad to say it had been able to put many of them right. He was grateful to individuals who had drawn attention to those matters, and he could assure them that every case brought to the Committee's notice had been put to the Ministry of Health, either individually or as part of a general case. The urgent review the Committee was carrying out now with the Ministry had already produced some amendments.

The Minister recognized that the problems of the chronically designated areas could not be met just by the special payments for practising in those areas. An intensive inquiry was being carried out, and the Committee would join the Ministry in a special review of that serious problem. But as an interim measure it had been proposed that even if a doctor's main surgery was outside the specially designated area he would receive the whole payment if 80% or more of his patients lived in the area, and proportionately less down to 60%. Under that figure he would not receive the payment. The circulars would be produced shortly and payment would be with effect from 1 October 1966. In the case of groups which ceased to fulfil the conditions for group payments owing to departure of a member of the group the payments would continue as at present till the end of the quarter, and for a further four quarters where a replacement was genuinely being sought.

Dr. Cameron said it was proposed that doctors who had started postgraduate education but had not completed 10 sessions at recognized courses before 1 October 1966, so as to qualify for the £60 payment, should be paid for the sessions to their credit at October 1966 on a pro rata basis.

Vocational training payments would be made when a traineeship had been held for at least nine months and not necessarily the whole year. In the case of seniority payments breaks of up to 15 months spent in general medical services would not invalidate seniority as a principal. In breaks away from general practice seniority as a principal would be reaggregated after a further five years as a principal.

That was only a rough outline of some of the main points, said Dr. Cameron. Circulars would follow and other matters were being persisted in.

Conditions of Practice

There was much relating to the conditions of general practice other than pay. Some matters which had remained unchanged for at least 20 years were being dealt with. A great deal of revision was needed. In Dr. Cameron's view it was essential to do the job carefully, painstakingly, and without hurry. This was particularly the case in the review of the Regulations and Terms of Service. He would limit his remarks to main considerations.

First there was the problem of practice premises. The repayment of rent and rates had started. Owing to slowness of valuations it might be a little time before some doctors received all that was due to them. He was determined that they should get what was right, and he reminded the meeting that injustices which many doctors had suffered since 1948 were being remedied.

Health centres had a particular topical interest, and many were attracted to them. It was thought they would enable doctors to provide the up-to-date service for the patients in the most economical way. That perhaps was so, but there should be caution. It was expected, with the help of experts in many fields, that a summary of the present position, with general guidance, would be produced. If doctors went into these centres they should be careful to continue to provide the personal service that was the hallmark of good general practice. There was a risk of becoming institutionalized. In this age of automation and computers family doctoring had to remain a personal service, said Dr. Cameron. He was sure that the future of general practice did not lie in conveyor-belt methods nor in adopting the atmosphere of the worst hospital outpatient departments.

One aspect of health centres which was causing concern was the extent of security of tenure. Attractive as health centres could be, they must not be allowed to weaken the doctors' position as independent contractors. They should let the G.M.S. Committee look at agreements they were asked to sign. The Committee would have them examined by legal advisers.

If doctors worked in premises provided by a local authority they would not be able to continue indefinitely to practise in those premises if they left the N.H.S. They were premises provided for National Health Service practice. Those were the hard facts. The G.M.S. Committee would always insist that doctors were not precluded from practising in health centres privately as well as in the N.H.S., but if they left the Health Service all that could be hoped for would be a reasonable period of notice to find other premises. When doctors owned their premises the position was quite different. He thought it essential that general practitioners should maintain their position as independent contractors. (Applause.) The development of better premises for family doctors was something for which all must work, but Dr. Cameron hoped that many doctors would find it possible to own and improve their practice premises, and thus remain completely independent.

The independent General Practice Finance Corporation was now in existence. He welcomed it. It could lend money under terms that could not be obtained elsewhere. The Group Practice Loans Scheme was being wound up. It had been an outstanding success. Originally the money had come from the Pool at the rate of £100,000 per annum of the doctors' money from 1953 to 1960 inclusive. Since the Royal Commission reported the money had been provided by the Government, but the capital had been allowed to continue to circulate in interest-free loans. Information about repayment of the sum of £800,000 which doctors had provided from 1953 to 1960 would be given as soon as possible.

Dr. Cameron referred briefly to other matters in the section of the Council's report on general medical services. He referred to the proposals for revising the constitution of the G.M.S. Committee. It had been decided to defer that matter for a further year, and he asked Chairman's permission to withdraw paragraph 54 of the Annual Report of Council and motion 260 on the Agenda.

Dr. Cameron concluded by saying that doctors were in the middle of a complicated revolution in replanning the whole of general practice. He welcomed the chance of looking at some of the problems which had emerged from the original Charter negotiations and the new system of remuneration. The full effects would not be obvious for some time, but he was confident that it would be possible to overcome whatever difficulties arose. But it was unwise to make hasty judgements. There were still tough times ahead, but he was sure that in the end family doctoring could be made what it should be—the foundation of the practice of medicine in the country. (Applause.)

Remuneration and Terms of Service

A motion in the name of Cambridge congratulating the G.M.S. Committee on its firm stand " which insisted on the implementation of phase II of the Charter on 1 April 1967," was carried.

Dr. J. N. REDFERN (East Yorkshire) moved: " That, with reference to paragraph 17 of the Annual Report of Council, the standard capitation fee is inadequate, and should be raised to a level directly and realistically related to the consultation rate."

He said the motion was short and clear, and was very much in line with a similar motion carried unanimously at the Conference of Local Medical Committees in June. The average consultation rate varied throughout the country, but it had shown no sign of falling off since implementation of the Charter. In the past four years in his practice the annual consultation rate had risen from 3.5 to 4.2. The value of the pound fell as each year passed. The result of the Charter and the Review Body's Award had been to raise fringe benefits—ancillary help, rent and rate payments, group practice, and seniority and designated area payments. These were welcome and well fought for, but, taking an average doctor with none of those additions, the pay for general medical services had fallen far short.

Dr. B. TAYLOR (Tower Hamlets) moved an amendment: " That, with reference to paragraph 17 of the Annual Report of Council, the standard capitation fee is inadequate and should be raised to a realistic level."

He said his Division put this amendment because if from the beginning doctors had had a reasonable capitation fee there would not have been many of the problems which had arisen.

Dr. CAMERON accepted the amendment.

Dr. LUFFINGHAM (Council) spoke against the amendment, because it was a direct negative. The amount of the capitation fee needed to be calculated in a different way. The £1 bore no relation to the amount of work done. If the amendment was accepted it would not help.

The amendment was lost.

Dr. W. J. C. SCOTT (Dunbartonshire) moved an amendment to add the words: " and regrets that the statement of fees and allowances payable to general medical practitioners does not conform with the payments for items of service recommended in the seventh Report of the Review Body, and instructs Council to ensure that these payments be implemented."

He thought the immunization fees were too low. The Review Body had stated that the fee for these items of service should be 7s. 6d. per item. When it came to a course of, for example, cholera vaccine, which meant two vaccinations, the fee paid was for only one item of service. Attention had not been drawn to this anomaly, and the Council should take steps to see that the rates recommended were paid.

Dr. CAMERON said it was the Association's policy to get these payments made more realistic. The Review Body had recommended a standard fee for items or courses of service in pursuance of public policy, and it had been left to the health departments and the profession to agree on it. Seventeen shillings and sixpence had been agreed for a three-injection course. He did not oppose the amendment, but the facts were not as the Representative Body had been led to believe.

The meeting agreed that the amendment should be added as a rider to the motion.

The motion, as amended, was carried.

A motion in the name of Guildford " That this Meeting affirms its determination to maintain the freedom of general practitioners as independent contractors, notwithstanding the inclusion of a salary as a possible means of remuneration for a small minority of general practitioners," was carried without debate.

Unilateral Power

Dr. D. V. CASHMAN (Tyneside) moved: "That the Minister's unilateral power to alter the Terms of Service is not acceptable to the profession."

Difficult as it was to believe, he said, after 20 years of the N.H.S. the contract which the family doctor was compelled to accept bound him to terms of service which the Minister might later change, perhaps to the doctor's detriment, after he had accepted them. The relevant paragraph of the Terms of Service read: "The Executive Council may, with the approval of the Minister, alter the terms of service as from such date as he may approve, by giving to each practitioner, subject to subparagraph 3 of this paragraph, notice of the proposed alteration."

It was true there were recommendations that the Minister should consult "such organizations as he may recognize as representing practitioners," but he was not required to follow any advice he might be given, so that the terms of service could be altered without the profession's agreement. That would make nonsense of negotiation. It was no use saying it had not happened, or was not likely to happen. The Representative Body should declare that it would never happen "by insisting upon the immediate revocation of this iniquitous anachronism: the Minister's absurd and intolerable privilege in this matter."

Dr. CAMERON said that the offending passage had been extracted from the new draft Regulations. The National Health Service was based on an Act of Parliament, but it had been agreed that there would be no alteration of the terms of service without consultation with the profession.

Dr. CASHMAN, in reply, said that it might be suggested he was tilting at windmills. He had had a letter from the Windmill, or rather from the Elephant and Castle, as follows: "The terms of service are now being recast in consultation with the profession's representatives, and it would not be surprising if this particular provision disappeared. Yours sincerely, Kenneth Robinson." If the Minister himself accepted that the present position was inequitable "who are we to say him nay?"

The Tyneside motion was carried.

Another motion by Tyneside, "That the Review Body's urgent attention be drawn to the fact that, up to April 1967, Government implementation of their recommended award in respect of general practitioners falls short by approximately £18m., and that the Review Body be invited to recognize this fact in their next report," was accepted without debate.

Basic Practice Allowance

Dr. M. GOODMAN (Liverpool) moved: "That this A.R.M. considers that the present level of remuneration for the basic practice allowance is unrealistic."

He said they were dealing with the money which was needed for the basic requirements of general practice. He referred to some of the items it was supposed to cover, and he thought the amounts were unrealistic.

Dr. D. BURRELL (Winchester) said he would be glad to see the basic practice allowance itemized, but he would be sorry to see the motion carried completely. An increase in the basic practice allowance would approach nearer to a salaried service.

Dr. CAMERON said the question of the size of the basic practice allowance was something that had to be looked into.

The motion was carried.

Dr. JEAN E. LAWRIE (Dartford) moved: "That this meeting is disturbed to learn that executive councils are assessing the eligibility for basic practice allowance of part-time practitioners on the number of prescriptions they are writing."

She said the Dartford Division was disturbed to learn that in some areas executive councils were using the total number of prescriptions prescribed by a doctor in a given time as a yardstick to measure a general practitioner's activity. Dartford was utterly opposed to the practice; the number of prescriptions prescribed in any given time was not a valid measure of quantity or quality of work. It was degrading to doctors to be assessed in that way. She asked the Meeting to join Dartford in its concern at the implication of this activity of executive councils and to carry the motion.

Dr. D. R. COOK (Camden) said that there were executive councils using prescription counts as a way of measuring the activity of practitioners. It was a practice which the Representative Body should vigorously oppose for two reasons. Firstly, it was something being done as a check, unknown to the doctor, and, secondly, it was a most inefficient instrument to gain the required information. It was a wholly fallacious exercise which gave wholly fallacious information, and it had to be resisted.

Dr. J. S. NOBLE (Council) supported the motion. He had had instances brought to his attention where women doctors and others had almost been given the "third degree." If it was wanted to get women doctors back into part-time practice this treatment would not help. It was antiquated.

Dr. I. McD. G. STEWART (Blackpool and Fylde) said it was extraordinary that such a thing should be a criterion of worth in a practitioner. It was an active incitement to bad medicine to suggest that prescriptions should be written in greater number. He thought that if the number of prescriptions were halved or quartered the medicine practised would often be commensurably better. He supported the motion.

Dr. CAMERON said he was equally concerned. He asked any representative who knew of the practice to report it to the G.M.S. Committee and it would take it up with the Ministry.

The motion was carried.

Itemize Allowance

The Meeting agreed that the wording of a motion by Nottingham should be amended to read: "That this Meeting instructs Council to ask the Minister to agree to the publication of each item included in the basic practice allowance."

Dr. I. L. LOCH (Exeter), moving the motion, said that a year ago, at a special Conference of the Representatives of the Local Medical Committee, the Chairman of Council had proposed that a motion by Inner London, asking that information be sought about the way in which the £1,000 basic allowance had been built up, should be referred to the G.M.S. Committee. Dr. Cameron had stated at this year's Conference that the G.M.S. Committee had made an informal approach to the Review Body on the subject, but had been told that if a formal approach were made to the Review Body it would not give the information, since the figure was based on confidential inquiries. The confidential information must have come either from the Minister or from the profession. He was sure that representatives had no wish for that information to be confidential. The motion had asked specifically that the basic practice allowance be itemized. He assumed that the refusal by the Review Body was because the Minister himself wished to keep the information confidential. It was difficult to understand on what grounds the Minister wished this information to be withheld.

It had not been completely clear in the seventh report of the Review Body what the basic practice allowance was intended to pay for. The evidence from the profession to the Review Body stated that the basic practice allowance was intended to consist of, firstly, reimbursement of standing expenditure—a phrase which had not been defined—incurred by every general practitioner. Did that mean telephone costs, heating and lighting, car expenses? Nobody knew. There were so many anomalies that it should be insisted before the Review Body made recommendations in 1968 that the Minister and the profession should agree the content of the basic practice allowance.

Dr. J. R. EDWARDS (Exeter) said it was difficult to discover exactly what was covered by basic practice allowance. Until that was known he thought the matter could not be argued further. The facts must be known before further claims could be made. His only concern was that if the Minister refused and the Review Body refused where was the profession then?

Dr. S. J. CARNE (West London) wondered if the Meeting would accept the motion as a reference to the Council, with the clear understanding that it was not to be put off by vague phraseology such as "general expenses." The change in the wording of the motion had extracted much of the bite from it.

Dr. CAMERON said that, subject to the wishes of the Representative Body, it was in mind to seek an itemization of the basic practice allowance from the Ministry and the Review Body. What the Review Body had said was that it was dependent on confidential inquiries which it had made on its own account. That meant that the subject was not quite as simple as it had been put.

The motion was carried.

Seniority Payments

Dr. P. W. LUMLEY (Bromley) moved: "That this Meeting draws attention to the loss of seniority awards due to a break in continuity of service and urges the strongest possible representations to the Minister for immediate correction of this unjust anomaly."

He said that the agreement to permit the principle of seniority awards to be united with a penalty, which also acted as a disincentive, was irrational. It was a long haul to the final seniority payment—probably at the age of 60. As some wags would have it, it was "a senility award." That should be seen for what it was—an incentive bonus for those who could retire at 60 to stay on and to improve their final pension should they live to receive it. If seniority was so to be rewarded it should be rewarded without strings attached.

Dr. S. Copp (Cardiff) pointed out that there were conditions which could be altered by regulations. For instance, the Minister might suddenly decide that doctors would have to do a six-weeks refresher course each year to qualify for an award.

Dr. H. F. C. Johnson (East Norfolk) said that it was a classic example of one Ministry encouraging doctors to go overseas to serve in developing countries and another Ministry penalizing them for so doing.

Dr. Cameron said he was interested in what the last speaker had said about medical service overseas. The Ministry had been "hammered" on that question, and the Ministry would not relent. He took it that the motion would be passed and that it would be an instruction "to go back again." He thought it was quite wrong that a doctor should suffer in seniority because he elected to serve overseas.

The motion was carried.

Service as Assistant

Dr. R. T. F. Morrall (Grimsby) moved: "That all service in N.H.S. general practice should count towards seniority awards, including service as an assistant."

He said that every practitioner was eligible for a seniority allowance when his name had been continuously included in the *Medical Register* for 15 years from the date of registration and he had been a principal for the last five of those years. The motion sought to establish that the services provided by a doctor working in general practice, whether as a principal or as an assistant, should not differ in any material way from the point of view of seniority. He thought it particularly applied to a doctor moving to another practice, as an assistant with a view.

Dr. Cameron thought it might be impossible to get a blanket agreement. He agreed that it was something on which the profession should take to the Minister again. There were cases of doctors who were penalized.

The motion was carried without dissent.

A motion by Guildford, "That seniority payments should be payable at 15, 25, and 35 years from qualification and not from registration," was, by leave, withdrawn.

Dr. S. Copp (Cardiff) moved: "That the second point in the payment scale for seniority should be related to 20 years of service."

He said he had in mind doctors who had spent some of their medical life in the armed Forces, and as a result their service in the National Health Service had been limited. Cardiff thought that these doctors should be able to make up for the time they had lost in the armed Forces.

Dr. Cameron said that if the Meeting would approve the motion as a reference to Council he thought that should meet the case. He would hesitate to accept it as a binding instruction.

The motion was passed as a reference to the Council.

A motion by Dartford, "That seniority awards should increase annually after 15 years," was, by leave, withdrawn, and a motion by Cambridge, "That the pre-registration year should be allowed to count for seniority awards," was accepted.

Vocational Training Allowance

Dr. Joyce E. Brooks (Southampton) moved: "That the vocational training allowance should continue when the seniority award is granted."

She said that a young doctor who took the trouble to prepare himself for general practice by three years in hospital received £125 per annum when he went into general practice. When he had been on the register for 15 years he was presumed to have grown older and wiser, and yet he got only £200 per annum. Southampton thought that the vocational training allowance should continue for such a doctor.

Dr. H. S. Howie Wood (Isle of Wight), supporting the motion, claimed that the whole question of postgraduate grants needed looking into. Priority approval was essential, and that had been refused in many cases for lectures of a high standard. The Ministry should encourage general practitioners to take as much postgraduate training as they possibly could.

Dr. Cameron said that the vocational training allowance was set apart for a certain purpose. The seniority award had another function. Was it right that because a doctor did that extra time in practice he should have that allowance for the rest of his life? It seemed to Dr. Cameron it would be very difficult to justify it.

The motion was lost.

Dr. J. D. Sinson (Leeds) moved: "That this Meeting deplores the fact that when a practitioner receives a seniority award he loses the postgraduate training grant."

He said his Division thought that this was an important matter of principle. It was wrong that when a doctor qualified for one sort of allowance his entitlement to another and completely different allowance should then be ended. It seemed to Leeds that it was wrong that the postgraduate education allowance and the seniority awards should be grouped together. The doctor had earned his seniority pay for his work in the National Health Service and he should still be entitled to his postgraduate allowance.

The motion was carried.

Qualification for Payment

Dr. W. F. de C. Veale (Brighton and Mid-Sussex) moved: "That urgent action be taken to publish details of the requirements for attending a stipulated average number of sessions per annum of approved postgraduate training in connexion with qualification for payment or continued payment of an addition for seniority in accordance with paragraph 17 of the 'Statement of Fees and Allowances payable to general medical practitioners.'"

He explained that the only purpose in bringing the motion was to emphasize to the negotiators that there was considerable worry, if not alarm, that there had been no announcement about how much postgraduate training was required. No one wanted to have to crowd in three to four weeks' training in the last year, 1968 to 1969, to bring up their average to the required number of sessions. Under the new basic salary arrangement there had been a slight drop in the number of applications for postgraduate courses in the first half of 1967, but in 1968–9 it might be impossible to get a place on a postgraduate course if details of requirements were unduly delayed.

Dr. Cameron hoped the Meeting would pass the motion unanimously. The matter would be settled as quickly as possible and it would be seen to that the time was extended, so that doctors would find no difficulty in fulfilling the requirements. He gave that assurance.

The motion was carried.

Dr. G. L. Powell (South-west Wales) moved: "That, with reference to paragraph 17 of the Statement of Fees and Allowances as payable to general medical practitioners in England and Wales 1966, Council be asked to investigate the position of the doctor unable to attend the postgraduate training necessary to obtain a seniority award."

He reminded members that paragraph 17 stated that "On and after 1 October 1969, in order to qualify for a payment or continued payment of an addition for seniority in a period of 12 months from 1 October in any year, the practitioner must, during the years from 1 October 1966 (or since becoming a principal in general practice if this was later) to that date have attended a stipulated average number of sessions per annum of approved postgraduate training. Further details of the requirement will be issued in due course."

His Division thought it was iniquitous that a seniority award should depend on postgraduate training. However, the condition had been accepted with the Charter. But that was not to say that the Charter must not be under constant review and, when necessary, revised. All doctors knew the difficulty of obtaining a suitable locum. Single-handed practitioners had already lost their group-practice allowances through being prepared to work long hours in an isolated community. Must they now lose their seniority award for the same reason? In the later years of their professional life they would be losing £650 a year for these two reasons. Was the opinion of the profession so poor that it was thought a doctor was no good unless he did postgraduate training? Did the original years of training, the years of experience in practice, count for nothing? This required immediate action to rectify the position which at present interfered with the freedom of the doctor to practise where he wished as well as penalizing him financially.

Dr. Cameron said that if there were special cases of difficulty in isolated rural areas for single-handed practitioners particulars should be given and something done. He accepted the motion on the understanding that special cases would be investigated as they arose.

The motion was carried.

Elderly Doctors

Mr. R. J. Williams (North Glamorgan and Brecknock) moved: "That family doctors over the age of 70, providing full-time general medical services, should not lose seniority payments."

He pointed out that many doctors in this age group were still in active practice, and if it was allowed that a practitioner qualified for the basic practice allowance it must follow that he was undertaking full medical services. Why, therefore, cut down his income? It discouraged work by experienced, established, and known general practitioners at a time of extreme shortage. "In South Wales," he said, "the fact that a general-practitioner service can still be maintained is due in no small measure to the number of doctors over the age of 70 still in active practice."

Dr. J. S. HAPPEL (Winchester) moved as an amendment: "That until 1972 family doctors over the age of 70 years providing full-time general medical services should continue to enjoy seniority payments."

He said that the unique contribution of those approaching 70 was recognized, and the amendment limited the seniority benefits to a term of five years, when it could be reviewed.

Dr. F. E. GOULD (Birmingham) thought the original motion adequate and that doctors should continue in practice so long as they were capable of doing a full day's work. Dr. D. BURRELL (Winchester) supported the amendment, because it would be unfair to stop the seniority payments immediately of those doctors aged over 70. They should not in normal circumstances be practising full-time medicine, and this should not be encouraged by extra payments.

Dr. B. L. ALEXANDER (Manchester) said that there were 3,000 doctors over the age of 65 out of 23,000 general practitioners. Those in the 65-and-over age group were the doctors who had had to wait years and years for their compensation. They were the ones who would get poor pensions. They were the ones on whom the country was relying to keep the Health Service from falling apart. Yet at the age of 70 the seniority to which such doctors were entitled was being stopped. While there was a shortage of general practitioners the best possible should be done for all those who could do a full day's work.

Dr. CAMERON said that the overwhelming support of the Representative Body was needed. All the arguments had been used on the Ministry and no progress had been made. Two vacancies in the last few weeks had been filled by applicants aged over 70. He would be the first to say that a situation should not be perpetuated where doctors went on practising when they were past it. Nevertheless, as things were at present, it was a crying injustice that doctors asked to stay on because of the shortage of medical manpower should have to accept this cut in remuneration merely because they had passed their 70th birthday.

The amendment was carried by a large majority.

The amended motion was carried as the substantive motion.

Inducement Payments

Mr. R. J. WILLIAMS (North Glamorgan and Brecknock) moved: "That the criteria at present laid down for inducement payments to family doctors are wrong and should be urgently reviewed."

He pointed out that the basis of designation of an area simply on the doctor–patient ratio and the requirement for designation to be operative for a period of three years before the inducement payment could be offered were criteria which were not only too narrow but might be too late in operation. The system should be more flexible and rapid in operation. Work loads should be taken into consideration. Patient demand was also significant. In South Wales the load was twice the national average and three times that of the lightest areas. The morbidity among old doctors in those areas, because of sustained overwork, was high, making a still further increased burden on colleagues. Areas might be uncongenial. Terrain might be difficult. Building land might be scarce, or poor, or unattractive. Educational facilities might leave a lot to be desired. First-class district hospital facilities might not be readily available. Surgery accommodation might be inadequate. All those and similar factors should be appraised and perhaps an assessment made on the points system. That would provide a broader and more realistic basis and avoid the difficulties of the present system.

Dr. N. STRANG (South Shields) moved as an amendment: "That the criteria at present laid down for inducement payments are wrong and should include unattractive industrial areas where the doctor–patient ratio remains constantly high."

He explained that the purpose of the amendment was to draw particular attention to some of the industrial areas which were unattractive, where the work load was heavy, and the doctor–patient ratio high. It was to draw attention particularly to those which were not designated and to see that some inducement allowance was awarded to doctors in such areas.

The amendment was carried.

Dr. CAMERON said that when chronically designated areas had first been discussed it had been possible to define five such areas in England and Wales. The idea had been to encourage doctors to go into those areas, at the same time recognizing the heavy work load that they would have to cope with. The whole picture had changed since then, and there was no pattern of designation over the country. The question of designated areas, apart from the chronically designated areas, now had to be tackled. The new scheme would be without detriment to the doctors already in designated areas who at present came under the scheme of remuneration which had been agreed.

Dr. F. O. WELLS (East Suffolk) said that the suggested wording left the criteria wide open. It was said that the inducement payment would be paid in sparsely populated areas or for other reasons which made the area unattractive to doctors. If those criteria could not be fulfilled whatever Dr. Cameron had done might well be undone. Care must be taken about the manner in which the motion was accepted.

Dr. C. J. SWANSON (Council) said there were two entirely different problems. One was inducement payments, which had already been introduced in Scotland, and the other was special payments for unattractive areas. Special payments would not solve the problems in the unattractive areas, and an improved solution should be found, but it would not, on the other hand, be possible to carry on without inducement payments in Scotland.

Mr. WILLIAMS, in reply, said there were two types of criteria to be considered—those for designated areas and those for inducement payments. There was little doubt that many areas which were not designated in South Wales were grossly under-doctored, and inducement payments were needed to encourage doctors to go to these areas. Such things as work load and environment should be taken into consideration when criteria for inducement payments were being considered.

The motion, as amended, was lost.

Night Visits

The CHAIRMAN moved a motion drafted by the Agenda Committee under Standing Order 16 (iii): "That Council be instructed to negotiate more advantageous terms for night visits."

Dr. D. R. COOK (Camden) moved an amendment: "To add 'and to alter the statement of the practitioner on Form E.C. 81 to certify that the patient has been visited to avoid the need to introduce modified claim forms for the use of deputizing services.'"

Dr. Cook said deputizing services would become more important in the future and would spread to many new areas. Executive councils had issued modified claim forms for night visits in the areas where deputizing services were used providing for the signature of both the principal who would receive the payment and the deputizing doctor who had made the visit. That caused a lot of unnecessary trouble. The principal should be allowed to certify that the patient had been visited, and this should be all the executive council should require.

Dr. GOULD (Birmigham) disputed what Dr. Cook had told the Meeting. There was no need for a special form to be used for cases seen by a deputizing doctor. It was perfectly in order for the doctor to sign *per pro* the principal doctor, and the forms were sent to the executive council direct. The same principle applied in the rotas system.

Dr. R. G. TROUP (Havering) said in his area not only were there deputies for general practitioners but deputies for doctors in the deputizing services. The local executive council had produced a number of forms all amending the original form E.C. 81, which were becoming so complicated that it was difficult to understand them, and the interpretation put on them by the executive council might be entirely false.

The amendment was carried.

Dr. S. COPP (Cardiff) moved the amendment: "That the following sentence be added to the motion: 'This should be made to apply equally to subsequent visits, after the first, when the condition of the patient indicated that such further visits be made.'"

Dr. Copp said he understood the second visit could not attract a separate fee, although Dr. Cameron had indicated that this was not so. If Dr. Cameron was correct, and a second fee was available, he would be happy to withdraw the amendment.

Dr. CAMERON said if any doctor had difficulties with an executive council he should let him know and the matter could be investigated. It had not been envisaged the fee should be for only one visit. The doctor might well have to go back on a second occasion, and, if so, was surely entitled to a second fee.

The amendment was carried.

The Meeting accepted the following motion from Birkenhead and Wirral: "That this Meeting objects to the patient having to sign the night-visit form."

Dr. J. H. MARKS (Barnet) moved an amendment to add the words: "and all other forms for item-of-service payments."

Dr. Marks said that the signature of a doctor was important. It was accepted without question by private individuals and Governments on all forms of certificates, often involving large sums of money, yet to claim a paltry pound for a night visit or 7s. 6d. for a vaccination the doctor's signature was not enough. It had to be countersigned by the patient, who might not be able to read let alone understand the form. If patients bothered to read the form they realized that the doctor claimed a fee, and, not knowing this was a pittance, thought the doctor was making a fortune. Patients also realized they were acting as time-keepers to make sure the doctor clocked on and off between midnight and 7 a.m. If the Government did not trust the doctor why should the patient?

The amendment was carried, and the motion as amended was carried.

At this point Dr. MATHIAS resumed the chair.

Grants for Assistants

Dr. T. J. CARTER (Finchley) moved: "That a general medical practitioner should qualify for a grant for an assistant if he has a National Health Service list of 2,500 patients or upwards."

Dr. Carter said that the motion had been put forward because a general practitioner in his area felt aggrieved that payment for an assistant was made only when the list size was about 3,000. The figure of 2,500 or above went into the range of practices which were above average list size. In addition, in a group practice the doctors merely had to show that they had at least 2,500 patients each.

Dr. CAMERON said that there was of course a desire to make it easier to get the assistant allowance, but an even more urgent task was to obtain an amendment of the regulations to meet the case of rural general practitioners, and in particular single-handed ones, in areas where they could build up only a small list. It would be difficult to achieve both these things at the same time.

Dr. JOAN CHAPPELL (Council) supported the motion. She hoped the employment of both full-time and part-time assistants would be encouraged. Another type of doctor who might need help was the one with an average-size ordinary list but a large maternity list. She was particularly interested in opportunities for the employment of married women doctors and retired doctors as assistants.

Dr. CARTER, in reply, said that, in view of what Dr. Cameron had said, he would not like to think that the substance of his motion would get in the way of the rural practitioners, though in his view it might even help them.

The motion was carried.

Payment by Patients

Dr. W. S. S. MACLAY (Guildford) moved: "That this Meeting reffirms its support for the principle of a small charge to N.H.S. patients for each item of service rendered by general practitioners with exemptions in the cast of hardship."

The motion was carried.

Dr. J. C. OAKLEY (Medway and Gravesend) moved a composite motion: "That this A.R.M. remains of the opinion that an item-of-service payment by the patient at the time of usage, wholly or in part reimbursable by the State, is the only realistic method of limiting the increasing demand for service from the profession and of ensuring the intelligent and economic use by the public of the necessarily limited resources of the N.H.S., and firmly instructs Council to press this issue with the health departments."

Dr. Oakley said that the crisis in the National Health Service would continue unless the increase in demand by the patient for what he wanted could be limited to what treatment it was necessary for him to have. It had been said that ancillary help, group practice organization, appointment systems, and health-centre medicine would cut the doctor's work load, but many had found the work load had increased. Pharmacists had found their dispensing was now heavier than previously during peak winter months. The only way to achieve conscientious use of the doctor's time was to levy a fee for item of service.

Dr. A. I. McLEOD (York) supported the motion. It was essential to convey to the public that doctors were not, as was so often thought, crying out once again for a further increase in remuneration, but their policy was simply to ensure that people should realize that they could not, in the present economic climate of the country, receive more and more medical services at discount prices.

Dr. E. C. E. GOLDEN (York) supported the motion on economic grounds. The resources of the National Health Service were necessarily limited because it was competing with other Government financial commitments, such as pensions, roads, and education. On the other hand, the use of the Health Service was free, and the potential use of it by the public was limitless. The equation therefore did not balance and there was a state of disequilibrium between supply and demand. A charge on the patient would in some way help to restore the balance. Better still, it would remove the economic incentives that patients had at present to consult their doctors when they did not need medical advice.

Swing of Opinion

Dr. D. L. WILLIAMS (East Denbigh and Flint) said he was worried by the words "and firmly instructs Council to press this issue with the health departments." What had to be decided was whether a further approach to the Ministry now would bring nearer the day when the Government accepted this policy. Already there was a swing of opinion in all political parties towards selective social benefits and even towards the idea of payment by the patient. People were beginning to realize that the public purse was not bottomless, and that patients with money must help to provide a better service for all. If Dr. Cameron went to the Minister now the Minister would say "no," and that would make it more difficult to say "yes" later. Dr. Cameron would have to show that the proposed B.M.A. policy was designed primarily to benefit patients, and not doctors, that the additional money it produced would be used to increase the scope and efficiency of the service, and not to line doctors' pockets, just as doctors themselves must emphasize that the extra time given to them by the diminished work load could make possible a higher standard of medical practice. The Minister knew quite well what the profession wanted, and why. To approach him at the present time might do nothing but harm.

Dr. G. N. MARSH (Council) said that the increasing use by doctors of paramedical personnel was relevant here. An empire was being built geared to a free-at-the-time service, and it left the patient without any responsibility for its proper use. He was an enthusiastic supporter of the use of paramedical workers, but the profession might be creating a huge empire which when a fee was introduced would explode like an over-inflated balloon. If there were a fee-at-the-time instead of a free-at-the-time service doctors would know what were the genuine medical demands.

Dr. J. F. BURDON (Torquay) said he thought that a fee for item of service was a disincentive to get the patients well. It would mean forms galore. It created a problem which did not exist before—the patient with no cash. A charge was not the only realistic method of reducing the work load. There were other methods, some of them good and some of them bad. Dentists and pharmacists had recently received payments for certain services and already they were beginning to rue it.

Dr. H. GLYN JONES (Bromley) opposed the motion, because as it was written it would apply not only to general practice but also to the hospital service. He asked the Meeting to think of the problem that would be created. This motion was wide enough to cover even the casualty patient. It was not a reasonable proposition.

Mr. D. N. MENZIES (Liverpool) urged caution. If passed the motion would be political ammunition and the press would say that the doctors had given instructions to prepare an alternative health service. The motion was virtually proposing a non-free health service, and the B.M.A. should have regard to its public image.

Dr. OAKLEY, in reply, said the A.R.M. had reaffirmed the policy of a direct charge to patients, but this proposal would not refer to the hospital service. There had also been reference to the problem of diminishing responsibility to the patient. Doctors could look after patients better if they had fewer to see. Some item-of-service payment by the patient at the time of consultation would reduce the number of irrelevant consultations, and if there were some form of fee it would be much easier for the patient to go to the chemist and buy a bottle of medicine for the same fee.

A motion that the Meeting pass to the next business was carried.

A motion by Medway and Gravesend, "That this A.R.M. instructs Council to pursue further payment by item of service as an alternative method of remuneration as laid down in the Family Doctor Charter," was carried.

Evening Surgeries

Dr. D. J. ADDERLEY (Lewisham) moved: "That it is desirable that all evening surgeries should close by 6 p.m. in agreement with the Minister's letter and the executive council notice E.C.N. 570."

He said that the motion he proposed was not preoccupied with money but with easing the work burden of general practitioners. Doctors could in fact shorten their day's work if they wanted to. Why did they not do it? The first reason was that the traditional service which the general practitioners gave was a long day's service to fit in with the patient's free time. The second reason was fairness to patients. Many people thought that if doctors stopped at 6 p.m. they would be preventing patients from seeing them. That was untrue. In the past four years he had closed his door at 6 p.m. and there had been virtually no complaints, said Dr. Adderley.

Dr. R. P. HENDRY (Rugby) moved as an amendment to insert the words "be entitled to" after "should." He said he was appalled by Dr. Adderley seeking to dictate what time he (Dr. Hendry) should finish his surgery. If the motion was passed and he decided to go on to 6.15 or 7.30 p.m. then he was doing something that the Association said was undesirable. They were independent contractors.

Dr. R. COVE-SMITH (St. Marylebone) seconded the amendment.

A motion that the question be now put was carried, and the amendment was then approved.

Dr. J. H. MARKS (Barnet) said he believed that the whole concept of surgery work was an anachronism. Most doctors were in practice for two reasons: to make a living and to help their patients. To do both of those things they needed to see their patients most of the day. They resented being told how to run their practices.

Dr. A. W. MACARA (Junior Members' Forum) said that if general practitioners wished to end their evening surgeries they should be given the facilities to do so. The Meeting was not trying to dictate to those who in different circumstances in rural practices or for some other reason might wish to have an evening surgery.

Dr. J. MCGLONE (Glasgow) thought the doctors' obligation was simply to provide all necessary attention, and if that could be arranged before 4 p.m. then why not? As independent contractors doctors must retain the right to determine their own arrangements within their terms of service.

It was agreed that the question be now put.

Dr. ADDERLEY, in reply, said that the opinion of the Representative Body was the opinion of the profession as a whole. If the Meeting advised what it considered was desirable then that was not dictation.

The motion as amended was lost.

Group Practices

Dr. F. V. GRIFFITHS (Wandsworth) moved: "That this Meeting formally protests to the Government against the pressure applied to general practitioners to form group practices and protests against the concomitant financial and other discrimination against single-handed practitioners."

He said there was a danger of the single-handed general practitioner being squeezed out of existence. Over the last few years there had been a concentrated effort to discourage single-handed practice and encourage group practice, and even financial pressure had been used. To quote from paragraph 205 of the Review Body's Seventh Report: "The allowance for group practice is intended to provide a financial incentive to doctors to embark upon group practices from central surgery premises. The group practice interest-free loan has provided some incentive in the past . . . and, even though it is now to lapse, its place will be taken by the scheme for direct reimbursement of expenditure on practice premises, which will mean that the cost of raising capital for group practice will be directly reimbursed."

That meant that, though single-handed general practitioners had the basic practice allowance, they were denied the £200 per annum allowed to their colleagues in groups. They had to suffer a much higher percentage of their income going on expenses; when illness struck they were often lucky to get a locum—who in London in the summer might cost £80 per week—and there had also been an inference that single-handed general practitioners were in some way inferior.

Dr. Griffiths said he believed that patients of a first-class, single-handed general practitioner were equally well if not better served than those of a first-class group practice.

Dr. F. O. WELLS (East Suffolk) moved an amendment that the words "in rural areas" should be added at the end of the motion. He said that in urban areas it was possible for single-handed practitioners to work within a group and still retain the character of their single-handed practice. But rural practitioners geographically were less able to do that.

Dr. J. S. HAPPEL (Chairman of the Rural Practices Subcommittee) said he would be quite happy to support the motion as it stood, because it applied to single-handed doctors generally. His Subcommittee had set up a working group to study the whole future of practice in rural areas, and certainly the position of the single-handed doctor loomed large in these discussions.

The amendment adding the words "in rural areas" at the end of the motion was lost.

Dr. R. P. HENDRY (Rugby) suggested that if any group of practitioners was to be singled out for £200 a year it should be the single-handed practitioner and not the group. The single-handed doctors had the much harder job.

Dr. C. O. LISTER (Aldershot and Farnham) expressed much sympathy for the motion, but said that anybody engaged in group practice must know that far from reducing the work load it had increased it.

It was agreed that the question be now put.

The motion was carried.

Definition of Group Practice

Dr. J. H. MOIR (Guildford) moved: "That the G.M.S. Committee be asked to look again at the definition of group practice, in that many practices which provide the facilities of a group practice are unable for geographical reasons, and for the convenience of patients, to practise from one central surgery."

The definition of group practice, as "all members of a group must work in close association from a common main surgery, even if they sometimes were also working at branch surgeries," had led to some ridiculous situations where practices which had drawn group-practice loans were not eligible for group-practice allowance, because the members worked at two surgeries. A river or railway or, much more hazardous, something in the nature of a motorway might divide a practice in half.

Dr. J. D. SINSON (Leeds) spoke of the position in his own Division, where some doctors in receipt of a group-practice loan for six years no longer qualified for the group-practice allowance. The position was absurd and must be cleared up quickly.

Dr. CAMERON said that in the "Red Book" it was stated that "executive councils exercised discretion" in interpreting the terms of the definition. Many executive councils had used that discretion widely, but others had not. He would advise any representative who knew of a case of that kind that first of all it was essential to put pressure on the executive council through local representatives, and that there was a right of appeal to the Minister.

The motion was carried.

Direct Payment of Rent and Rates

Dr. S. C. C. SCOTT (West Essex) moved: "That this Meeting is of the opinion that the present system of reimbursement of rent, rates, and ancillary help is unsatisfactory."

He said that Dr. Cameron had already indicated some of the anomalies. Five shillings an hour was not nearly enough to cover the rate of pay of competent help at split and inconvenient hours, so he would say no more about that. Dr. Scott gave details of difficulties encountered in his Division in the interpretation of the regulations for reimbursement of rent and rates. He asked for more support in appeals to the Ministry.

Dr CAMERON said he hoped the Representative Body would not pass the motion in its present form: it was far too sweeping.

The motion was lost.

The Meeting adjourned at 6.30 p.m.

Second day: Friday, 7 July

The Meeting resumed at 9.00 a.m., with Dr. A. N. Mathias in the chair.

Payment for Rent and Rates (Continued)

Dr. G. C. Price (Bournemouth) moved, "That this Meeting congratulates the Chairmen of Council for acting with speed and vigour in leading a B.M.A. deputation to the Ministry of Health (*Supplement,* 22 October, p. 158) to protest about the fundamental changes contained in E.C.N. 569, para. 14, and E.C.N. 567, para. 2, from the basic principles outlined in the second and third reports of the joint discussions. It notes with pleasure that both matters have now been remedied."

Dr. Price referred to the report in the *B.M.J. Supplement,* dated 22 October 1966, and said that it was clear from it that the Chairman of Council considered the changes in the E.C.N. sufficiently important to warrant his personally leading a deputation to the Minister, thus putting the weight of the whole Association behind the protests against these fundamental changes. The changes in E.C.N. 569 had constituted a direct threat to private practice. It was quite inequitable that there should be a payment of rent and rates by principals not being paid at the universal rate. Dr. Price was sure that the Meeting would agree that the Chairman and deputation should be congratulated on the success they had achieved.

The motion was carried.

Dr. A. E. Loden (Tunbridge Wells) moved, "That this Meeting requests the Minister of Health to give written assurance that direct payments for rent and rates for surgery premises in no way implies a lease of these premises."

He said it was a worrying situation where there was a possibility of the Government considering leasing premises used for private practice. He hoped everyone had read in the *B.M.J.* that Headquarters had taken counsel's opinion on this matter. But counsel's opinion varied. He thought the Minister should be asked to give an assurance on this matter, because another issue was that the money was not going to be considered as part of practice expenses but as earned income. Until he was given such assurance he would have no part in taking rent and rates for his own private premises.

Dr. Cameron said counsel's opinion had been obtained and it stated that the danger regarding leases was non-existent. However, the Minister would be asked for his assurance on the question.

The motion was carried.

The Chairman formally moved a motion by Monmouthshire: "That the B.M.A. considers the present method of assessment of notional rent quite unjust and will discourage improvement of surgery premises. The notional rent should be assessed with regard to the capital value of the premises."

Dr. Cameron regretted that Monmouthshire's representatives were not present. He urged the Meeting not to pass the motion. He was prepared to accept it as a reference, because obviously the results of the scheme must be looked at all the time. It was too early to make a judgement. It was necessary to know what the "factor" (E.C.N. 569, para. 24) was and to see the final results of valuation of premises over the whole country. If individuals whose assessments had already been made felt aggrieved they should make local representations and use their right to appeal to the Minister.

The motion was lost.

Early Payment

Dr. M. Ross (City) moved: "That this A.R.M. considers that doctors should be entitled to submit a claim to the executive council for reimbursement of payments made on account of rent, rates, or ancillary help as soon as these payments are made, and that such reimbursement shall be made to the doctor within one month of receipt of his claim."

Dr. Ross said the motion dealt with a small but important subject. There was no reason why, having paid what might be quite large sums for rent and rates, a general practitioner should have to wait for repayments for anything up to 3½ months. Since the ancillary staff were paid weekly or monthly, the repayments to the general practitioner should be monthly. It was realized that monthly repayments for ancillary staff would give the executive council more work, but that would be balanced by the fact that the rent and rates payment would be spread over a quarter. If much of the doctor's income was to come through reimbursement repayments should be made within one month of the payment.

Dr. Cameron said it was true the executive councils had a lot of extra work at the moment, but these suggestions seemed reasonable, as one worked on monthly accounts in every other sphere.

The motion was carried.

Dr. W. F. de C. Veale (Brighton and Mid-Sussex) moved: "That this Representative Meeting urges an early settlement of the 'factor' referred to in paragraph 24 of E.C.N. 569 relating to direct payment for rent and rates."

Dr. Veale said it was no secret that the owner-occupier of a house in which he had his surgery got the worst deal under the repayment of rents and rates scheme. At present doctors were paid at the rate placed by the valuation officer on that part of the house used for the practice, with the promise that it would be multiplied by a factor later on. If that factor were greater than one, then the Government was withholding money owed to the doctor, but at the same time there was the threat that it could be less than one, and the doctor might have to repay some of it. He urged Dr. Cameron to treat this as an urgent matter.

Dr. Cameron accepted the motion, and it was carried.

Dr. J. D. Sinson (Leeds) moved: "That this meeting deplores the fact that no decision has been reached on the sum payable in reimbursement of rent and rates, which was to have come into operation on 1 October 1966."

Dr. Sinson submitted that the greater the time that elapsed before the factor was settled the greater would be the loss of confidence in the Minister's intention to make proper reimbursement of rent and rates. His Division deplored this.

The motion was carried.

Dr. D. Brown (Liverpool) moved: "That, in the event of non-agreement between a local executive council and a general practitioner in the matter of the proposed payments for rent and rates, recourse to independent arbitration shall be incumbent upon all parties concerned."

Dr. Brown said the concept of reimbursement of rent and rates was not a medical matter. It was known that the Association had sought counsel's opinion on the legal position and it was held that repayment did not come under the aegis of the landlord and tenant, nor was it governed by the Rent Act. It would appear that neither the law of property nor the law of equity applied to the situation. It was most probably related to administrative law. In Liverpool not only lawyers but also the Association of Chartered Surveyors and the Association of Estate Agents had been consulted. The one point on which all these organizations and lawyers were in agreement was the need for an independent appeals chairman.

Dr. Cameron, asking the Meeting to support the motion, said it was true that the negotiators had fought hard to obtain the Minister's agreement to the reference of appeals to an independent tribunal. They had been unable to obtain his agreement at that time, but it was increasingly clear that in time there would be an independent tribunal, and, more important, this would ensure justice was seen to be done.

Replying to a question from the floor, Dr. Cameron said that if any doctor submitted a case to a tribunal it was open to the other party as well to appeal. That was implicit in having an independent tribunal.

The motion was carried.

Dr. F. G. Tomlins (Waltham Forest) moved: "That, with reference to paragraph 19 of the Annual Report of Council, this Meeting requests that counsel's opinion on the risk of Government control of premises as a result of direct payments for rent and rates be made available in full to all members of the Association who desire it, or, alternatively, that it be published in full."

He said that it was difficult to get Government money without strings attached and it was the duty of Parliament to keep some control of the purse. Owning their own premises was the best assurance of independence for doctors, and the Government had an incentive to destroy that independence. The ownership of their premises was also their best security, and they would not want to become sitting tenants of the Government. Surely the best way to allay doctors' fears was to tell the full facts, and, unless there was some overriding reason why it should not be done, counsel's opinion should be made known.

Dr. Cameron said the Minister's assurance would be obtained and counsel's opinion would also be published.

The motion was carried.

Payments for Ancillary Staff

Dr. J. A. Rigby (Worcester and Bromsgrove) moved: "That this Representative Body is of the opinion that the present ceiling for the percentage reimbursement of payment for ancillary help is too low, and in order to recruit and retain staff of high quality this ceiling should be considerably raised."

He said that Dr. Cameron's comments yesterday on this subject had covered most of the things he wanted to say, but there were one or two points. The Association of Medical Secretaries recommended that the minimum starting salary should be £520 a year for a newly trained and newly qualified medical secretary. Those were completely inexperienced people. That was the maximum that the Ministry would offer. The Minister's offer worked out at 5s. an hour, which was just a little more than some of the cleaners earned. That sort of pay reflected on a system trying to attract and keep highly qualified staff.

Dr. E. H. J. COTTER (East Herts) moved an amendment to delete the words "should be considerably raised" and insert the words "should be removed."

He first examined the ceiling that the Exchequer put on indirectly comparable fields. A girl on a hospital appointments desk aged 21 or over was paid £849 a year; a staff nurse £850 a year. Did doctors want just a staff nurse? Should there not be someone comparable to a sister in the surgery? In the health department of a local authority the ceiling for the clerical Grade 1 and 2 was £1,020 a year; for the shorthand typist £820; and for the audio typist £780.

Dr. CAMERON said that the motion was sound and would put the Association in a very good negotiating position, but the terms of the amendment would put it back at square one, with all the difficulty about controls and so on.

Dr. COTTER, in reply, pointed out that there were three forms of control already, and he could see no reason why a fourth should be imposed which made the better doctor have to pay more.

The amendment was lost.

Dr. BROWN, in reply, pointed out that the Ministry had told doctors to use an appointments system and to employ qualified staff. How could they get suitably qualified ancillary staff for £500 a year?

The motion was carried.

Doctors' Wives

Dr. F. L. P. FOUIN (City of Aberdeen) moved: "That this Meeting considers that where the wife of a single-handed practitioner is wholly involved in her husband's practice in an ancillary capacity the allowance made in the basic practice allowance is inadequate."

The Meeting agreed to change the word "wholly" to "inevitably."

Dr. Fouin quoted from the Seventh Report of the Review Body: "We have also taken into account the fact that payment to wives and other dependants will not be included in the scheme for direct reimbursement of expenditure on ancillary help, and so will have to be made out of the remuneration from other payments."

He asked, "Which other payments and how much?" The situation might be acceptable for those in group practice, but for doctors in single-handed practice—especially rural districts—it was not.

Dr. JOYCE E. BROOKS (Southampton) regretted that the wording had been altered. The wife of a single-handed practitioner was not inevitably involved in her husband's practice in an ancillary capacity. It was quite possible to run a single-handed practice without a wife. "I have done it for 14 years," she said. (Laughter.)

Dr. FOUIN said that the word "inevitably," had been put in to overcome criticism that the ground was being cut under the feet of those moving later motions. It might have made more sense if it had been "if inevitably," but he thought the present version was basically correct.

The motion was lost.

Dr. A. E. LODEN (Tunbridge Wells) moved: "That this Meeting instructs our negotiating team to reopen negotiations immediately with the Ministry for the reimbursement of payments made to wives or dependants actually working as ancillary help, particularly in the case of those who have secretarial or nursing qualifications."

He pointed out that a motion of the Special Representative Meeting last year "instructed Council very urgently to find a solution." Six months had elapsed and nothing had been heard about it, so it must be assumed that it was now Association policy. Dr. Cameron had said two years ago that this was a matter "close to his heart." One had only to read the Review Body's Seventh Report to find that the negotiating team had got the subject muddled up with the general reimbursement for all wives. No member of the negotiating team seemed properly to understand the problem, otherwise they would not have made this mistake.

The CHAIRMAN said his attention had been drawn to Standing Order 25. The Representative Body was not competent to instruct the negotiating team. It was only possible for it to instruct the Council. He asked Dr. Loden if he was agreeable that the motion should be regarded as an instruction to Council.

Dr. LODEN agreed that it should be an instruction to the Council, but not a reference.

Dr. J. C. CAMERON said he did not want the Meeting to think that the Walls of Jericho would fall as easily as all that, and he assured Representatives that "we will try again."

The motion was carried.

A motion by Doncaster, "That, where existing staff have to work extra hours in order to cover the absence due to sickness or holidays of other existing staff, this extra payment involved should qualify for direct reimbursement of expenditure on ancillary help," was, by leave, withdrawn.

Dependent Relatives

Dr. D. J. P. GRAY (Exeter) moved: "That this Meeting instructs Council to inform the profession what were the checks and controls proposed by the Minister in relation to the employment of dependent relatives."

He quoted from the Annual Report of Council, that "the Ministry made it clear that it could not agree to direct reimbursement of a substantial proportion of payments made by doctors to their wives without considerable checking and control." Exeter believed that the profession had a right to know what those checks and controls were. If the Representative Body was to debate the problem of the relatives intelligently it needed to know the facts.

Dr. CAMERON said that in the case of a doctor's wife her qualifications would be examined, together with the hours she spent on duty, and the Ministry had in mind an inspectorate where the representative of the executive council could call at any time at the doctor's premises to see whether in fact his wife was employed on qualified duties. He could not see the profession agreeing to anything of this nature, and he asked the Meeting not to pass the motion. "You have given us instructions to negotiate. Let us go forth into battle and see what can be done."

Dr. GRAY, in reply, said that since Dr. Cameron had provided the Meeting with information about checks and controls he would withdraw the motion.

Permission to withdraw was granted.

Dr. GRAY (Exeter) moved: "That this Meeting instructs Council to determine and publish the commercial value of the work done in general practice by dependent relatives."

He said that Dr. Cameron had well summarized the present position in respect of dependent relatives—that the doctor should continue to pay his wife for the work which she did in the practice. It was important that the profession should continue this practice, for when the negotiators went back to the Review Body they must have a clear idea of practice expenses. His second point was that in formulating their recommendations the Review Body took into account practice expenses, including payments to dependent relatives. Thirdly, the Minister of Health had made it quite clear that the average payment in 1964 for all ancillary help in general practice had been a miserable £254 a year per doctor—this sum included nurses, secretaries, receptionists, dispensers, and dependent relatives. It was therefore perfectly clear that any payments made to relatives in the past had been purely of a nominal nature, since £254 could not have included a realistic payment for the services given.

Dr. Gray then outlined the work of a company in the Exeter Division consisting of management consultants and chartered accountants. It had, for the first time, professionally and independently evaluated the services of doctors' dependent relatives and had provided principles which would help the negotiators in arguing the doctors' case. The company had established that there was no limit to the amount a dependent relative should be paid, said Dr. Gray. Just as there was no upper limit to the work a doctor's wife had to do, so there was no upper limit to the payment. The principle of commercial evaluation would provide the negotiating team with the kind of evidence they had never been given before. "If you pass this motion," he said, "it will further this cause."

Dr. CAMERON said the issue was a highly technical one, and he was indebted to Dr. Gray for his close-knit argument. He agreed on the question of the commercial value of dependent relatives. He was prepared to accept the motion but was uneasy about committing himself about publication until he had a clearer view of the problem.

Dr. GRAY asked the Meeting's permission to delete the words "and published," and the Meeting agreed.

The motion, as amended, was carried.

Number of Dependants

Dr. GRAY (Exeter) moved: "That this Meeting instructs Council to determine immediately the number of dependent relatives working in general practice, their qualifications, and their geographical distribution."

He said that 13 months before the Representative Body had instructed Council urgently to seek a solution to the problem of dependent relatives. The motion was designed to obtain for the negotiators the facts they needed to press their case. It was important to find those dependent relatives who had special qualifications.

Dr. CAMERON said he considered the motion to be complementary to the previous motion. From the point of view of geographical distribution it was important to the problems of rural practice. He supported the motion.

The motion was carried.

It was agreed to amend a motion by Cumberland by the insertion of the word "partially." Dr. T. GARDNER (Cumberland) then moved: "That this Meeting considers that any pension contribution paid on behalf of ancillary staff should be partially reimbursed by the Government, and further that these pension rights should be transferable to any Government employment."

He said the present situation was that any doctor was obliged to carry the cost of providing for the pension rights of his employees. The matter had already been raised with the Ministry and there had been a reply, which was "typically parsimonious"—"We must treat the contributions on the same basis as contributions to National Insurance." It did not seem that National Insurance contributions were paid by all employers. They could be taken into account, and had been taken into account, when estimating doctors' expenses. Those doctors who paid superannuation paid into superannuation schemes for some of their employees. They had no kind of compensation for it and it seemed only right that what they paid in that way should be taken as part of the gross salary of the employee and that reimbursement should come from the Ministry on the same basis as the remainder of the employee's salary.

Dr. Gardner also argued that superannuation arrangements should be transferable.

Dr. B. L. ALEXANDER (Manchester) supported the motion. He said that ancillary staff were becoming a clearly defined group—specially trained, difficult to recruit, but without superannuation. Ancillary staff in the hospital service was superannuated, and if a member of the hospital staff should transfer to general practice then she lost her pension rights. Ancillary staff should be established as a superannuated class.

Dr. CAMERON said there had been discussions with the Ministry on the subject. The Ministry had given an assurance that it was going to consider this problem favourably. He thought these workers ought to have the benefit of a private pension scheme, and it should be treated as part of their remuneration. Dr. Cameron said that it ought to be possible to have a scheme whereby these girls could transfer from general practice to the hospital service or vice versa and retain their pension rights.

The motion was carried.

Payments for Special Experience and Service to General Practice

Dr. T. GARDNER (Cumberland) moved: "That this Meeting rejects 'payments for special experience and service to general practice.'"

He said that it would be hard to think of any matter that had come before the A.R.M. in recent years that had been more fully debated, canvassed, and investigated than this subject, almost to eventual boredom and irritation. Last year there had been 70 resolutions before the A.R.M. and three-quarters of them had been rejected unequivocally. The Representative Body had decided to give more time to the subject. There had been a working party and its report had been put before the general practitioners, almost 80% of whom firmly and, he hoped, finally had rejected the thing. In moving the motion he hoped that there would be a minimum of discussion, that the subject would be interred decently and quietly, and that by the size of the vote the Representative Body would indicate that it wanted to hear no more of the matter in the foreseeable future.

Dr. G. N. MARSH (Council), in opposing the motion, asked the Meeting to think for a moment of the position of a senior medical student or a junior hospital doctor. If they decided to enter hospital practice they no doubt dreamed that one day they would be at the pinnacle of the specialty they had chosen. If they entered general practice there were no pinnacles no matter how hard a family doctor applied himself to his practice. Family doctors were to some extent stultified by an egalitarian method of payment which made them all the same. What incentive was there if there were not some incentive payments? There must be some method of rewarding merit in general practice.

A motion that the question be now put was carried.

The motion was carried.

Postgraduate Education

Dr. R. P. HENDRY (Rugby) moved: "That the Review Body be pressed to recommend that an independent fund be set up for the furtherance of postgraduate education of general practitioners and for the encouragement of general-practitioner research."

Dr. Hendry said he was convinced there was a large reservoir of knowledge and expertise in various facets of general practice. It was already Association policy that adequate teaching facilities for general practice should be provided at undergraduate and postgraduate levels by practitioners actively engaged in general practice. Little progress had been made in that direction, through lack of money. The cost of such a fund would obviously be substantial, possibly in the region of £2½ million a year.

Dr. B. L. ALEXANDER (Manchester) said the motion was not an attempt to get the merit-award money under another heading but to express an opinion to the Review Body. "Let us use the money to train undergraduates in general practice, to train us in postgraduate work, and to help our research projects," said Dr. Alexander.

Dr. E. V. KUENSSBERG (City of Edinburgh) urged that there should be some clear thinking. While he agreed with the purpose of the motion, he felt the motion was not the way to go about it. Those responsible for the furtherance of general-practice education and research should have funds put into their hands through such organizations as the University Grants Committee and the Medical Research Council. The Review Body, on the other hand, was concerned with the payment of doctors for general medical services rendered to the population.

Dr. CAMERON reminded the Meeting that the money was Government money. The Review Body had set it apart and had said it was available if a suitable scheme could be found for its distribution. The Minister of Health could be approached with the suggestion that a fund might be set up along the lines of the motion.

Dr. HENDRY, in reply, said that he would be agreeable to the words "the Minister" being substituted for "the Review Body" if that were thought more appropriate.

The motion was carried.

Elections

It was announced that Dr. A. N. Mathias had been elected unopposed as Chairman of the Representative Body for 1967–8.

It was announced that Dr. J. G. M. Hamilton and Dr. J. Riddell had been returned unopposed by Scottish representatives as the two members of Council for 1967–8, and that Dr. T. W. Davies had been returned unopposed by Welsh representatives as a member of Council for 1967–8.

Other Items of N.H.S. Remuneration

Dr. E. H. J. COTTER (East Herts) moved: "That additional payments to practitioners in the case of sickness be raised to £50 per week."

Dr. Cotter said at present the sum to be paid in case of sickness had been agreed at £30. On consulting the advertisement columns he observed many figures of £65 a week plus accommodation for married couples as locum expenses likely to be incurred by a sick colleague.

Dr. CAMERON said the suggested target was a good one, and in that sense he was prepared to look at the matter again.

The motion was carried.

Dr. M. J. FORTH (Somerset) moved: "That additional payments during sickness should be the same for all general medical practitioners under the age of 70 providing unrestricted general medical services who are in receipt of a basic practice allowance."

Dr. Forth said that, though doctors were grateful to the negotiators for what they had so far achieved, it was still not enough. Only after 10 years' qualifying service did a doctor get the full rate. This penalized the young doctor entering practice who might have one or two years' qualifying service only but nevertheless a list of 2,500 patients. Admittedly it was much less likely for a younger doctor to go off sick, but if he did so he might be less able to withstand the financial strain than an older and more established doctor. Since the scheme was in its infancy still, Dr. Forth was prepared to accept the motion as a reference to Council for further consideration.

The motion was carried as a reference to the Council.

Dr. D. J. ADDERLEY (Lewisham) moved: "That the fee for emergency consultation where a patient is not resident for 24 hours should be at least that for a temporary resident, plus, if applicable, the night-call fee."

He said emergency consultations were probably the major cause of disturbance which occurred in a doctor's work. They usually occurred during a surgery or at night. In the Lewisham Division it was thought that consideration had already been given to the disturbance factor in that temporary residents were paid at the whole rate of a year's capitation fee. The fee of 12s. 6d. for emergency consultation was inadequate.

Dr. CAMERON accepted that the emergency treatment fee could well be increased. The negotiators had had great difficulty over this fee, which was an item-of-service payment. It was important that the item-of-service fees were watched and adjusted in the light of experience, but it seemed a little dangerous to tie the argument to the temporary-resident fee, because it implied other services. He preferred to keep the two issues separate.

The motion was carried as a reference to Council.

Family Planning

Dr. B. TAYLOR (Tower Hamlets) moved: "That this Meeting considers that when a patient attends a practitioner for family planning advice and examination this should attract a reasonable fee."

He said that with the advent of the pill and the coil more and more patients were going to their family doctors for family planning advice, and much time and energy was expended in this way. It could not be considered to be part of general medical services. The advice and examinations carried out should bring in a reasonable fee, and the fee should be paid by the patient. Ten shillings and sixpence was charged for a prescription to a patient for six months' supply of an oral contraceptive. This was a ridiculous fee.

Dr. CAMERON said there had been discussions on the question of providing a private prescription so that a patient might be able to purchase the pills and practise contraception on social grounds. This had been gone into thoroughly with the Minister, and the Private Practice Committee had set up a scale of fees. The difficulty was to determine whether contraception was on medical or social grounds. The view of the Minister was that he could not see how a doctor could determine that until he had examined the patient.

A motion to pass to the next business was carried.

Contraception for Social Purposes

Dr. S. J. CARNE (West London) moved: "That this Meeting is of the opinion that supervision of oral contraception for social purposes shall not be included in general practitioners' terms of service (Reference: Statutory Instrument 1966 No. 1210 Schedule 1, part 1, para. 10)."

Dr. Carne quoted the relevant regulation: "A practitioner shall not demand or accept any fee or other remuneration in respect of any treatment, whether under the terms of service or not, rendered to his patient, provided that nothing in this paragraph shall debar a practitioner from demanding or accepting a fee or other remuneration for (either) the prescribing of a contraceptive drug . . . where the drug . . . is not necessary to preserve the patient's physical or mental health, so, however, that no remuneration shall be demanded or accepted for an examination or advice connected with such prescribing and fitting."

It had been suggested that when doctors examined a woman to see if she needed an oral contraceptive they were determining whether or not there was a disease which, if present, would be treatable within their terms of service. If they prescribed an oral contraceptive and it produced side-effects those were treatable within those terms of service. He suggested it could be argued that that prescription too should be written on an N.H.S. prescription.

Dr. F. O. WELLS (East Suffolk) thought the motion a dangerous one. Supervision of oral contraception did not just include a prescription and an initial examination. If there were side-effects and complications he suggested that they would not be treated under the Health Service. Where was the line to be drawn?

Dr. CARNE, in reply, said that either the advice and the prescription were both within the terms of service or they were both outwith the terms of service. The Minister could not have it both ways.

The motion was lost.

Dr. J. A. BIRNIE (City of Aberdeen) moved: "That general practitioners should be able to give family planning advice and prescribe contraceptives as part of general medical services, and that remuneration of the practitioners should be on the basis of payment per item of service carried out for reasons of public policy." He explained the position in the City of Aberdeen, where the local authority clinic was not only giving advice on contraception but providing the pill and other contraceptives free. A general practitioner had to charge the patient, and the patient had to pay for the pills. Soon general practitioners would have no patients coming to them for family planning. The situation was illogical. It was therefore asked that general practitioners should be allowed to prescribe the pill under the N.H.S. without cost as a matter of public policy.

The motion was carried by 85 votes to 67.

Arranging Private Treatment

Mr. R. MYLES GIBSON (Leeds) moved: "That this Meeting deplores the failure of the Minister to correct what is a manifestly unjust and inequitable situation by refusing to agree to the alteration of the terms of service for general practitioners so that they may charge a fee of an N.H.S. patient when the patient insists on private referral for second opinion or treatment. The Meeting urges the profession's negotiators to persevere in this matter until justice is secured."

The Meeting agreed to an amendment: to delete everything after the words "general practitioners" and substitute "in accordance with the Resolution 311 of the Annual Representative Meeting, 1966, and urges the profession's negotiators to persevere in this matter."

Mr. MYLES GIBSON said that the motion simply registered the disappointment of doctors at their inability to put into effect the substance of last year's resolution, which read: "That paragraph 10, sub-paragraph 1, of the terms of service for medical practitioners as laid down in the National Health Service (General Medical and Pharmaceutical Services) Regulations, 1962, be amended, so that when a patient whose condition is such as to require treatment which is not within the scope of the practitioner's obligations, and who has been offered that treatment as available as part of the hospital and specialist services (Paragraph 7, sub-paragraph 1 of the terms of service refers), asks for private consultation and treatment by a specialist the general practitioner be allowed to charge a reasonable fee of the patient for making the arrangements and for attending the consultation(s) and treatment if requested to do so by the patient; and that to avoid abuse an appropriate declaration form be signed by the patient." This was in no way a censure of Dr. Cameron or his team but a request to the Meeting to endorse the motion.

Dr. CAMERON explained that the Minister had given an assurance that he would do nothing to discourage private practice. On the other hand, the Minister did not feel he should do anything to encourage it, and he had thought that proposal would encourage private practice. If the Meeting gave the motion its support the matter would be taken up again.

The motion, as amended, was carried.

Practice Premises

The CHAIRMAN formally moved: "That Council be instructed to review and report upon all aspects of general practice in health centres. (This motion has been drafted by the Agenda Committee under Standing Order 16 (iii))"

The motion was carried.

Dr. B. R. T. CARROLL (Croydon) moved: "That this Meeting asks the Council of the Association to safeguard the future independence of the profession by ensuring that health centre tenancy agreements are independent of executive council contracts."

He said his own local authority was itching to build health centres. The Minister had said that no more money would be forthcoming for infant welfare unless general practitioners could be persuaded to use the clinics as health centres. As a result, doctors in Croydon had made inquiries and had been concerned to discover that entry into health centres would entail surrender of the present contract and of the doctors' independence. As landlord, the Minister, through the executive council, would be able to exert total control over their practices.

Miss GLADYS M. SANDES (St. Marylebone) said that there were efforts to bring pressure to have the nominations of the appointments in these health centres made by the board of governors in the local teaching hospital, who wished to find a place to send clinical students, and, what was more serious, that the appointments should be made by the central board of governors and not by the local medical committee.

Dr. B. D. M. WILLIAMS (South Warwickshire) said that the key word was "independence." If enough doctors went into health centres the profession would be unable effectively to threaten resignation.

Dr. C. P. WALLACE (Council) thought that the G.M.S. Committee should issue a warning notice to all general practitioners about practice in health centres under existing conditions. In his opinion an amending Act was required and must be demanded, so that those practising in health centres could enjoy freedom and independence.

Remarking that there was a lot of muddled thinking on this subject, Dr. A. ELLIOTT (Redbridge) said the profession had to be careful when a new type of development was taking place, and he did not have to remind the Meeting that the type of medicine practised in the 1930s was, owing to economic and other influences, undergoing big changes. He knew that many doctors were not prepared, even with a finance corporation, to place themselves in a position of owing a lot of money. What worried him was there were doctors who were concerned more about being under the local health authority than they were under the executive council. The A.R.M. should not place rigid restrictions on its representatives.

Dr. CAMERON said that the previous day he had sketched out to the Meeting his feelings about health centres. He was pleased to accept the motions on the subject, though he was not entirely happy about the Croydon motion. "I have been quoted as being against health centres," said Dr. Cameron, "but this is not the case. I have already given you a balanced view of the situation, and those doctors who find it necessary to practise from health centres and undertake tenancies must be protected and their freedom and independence must be maintained. This is the basis of our thinking." He added that the G.M.S. Committee had set up a working party on the problem, and it hoped to issue a report as soon as possible. So long as the Meeting did not tie the Committee to motions like that from Croydon he was happy to accept the block of motions.

Replying to the debate, Dr. CARROLL said doctors in Croydon were not against health centres. They had, however, some experience of the way in which doctors were being pressurized.

The motion was carried.

Overseas

Dr. R. L. LUFFINGHAM, in the absence of the Chairman of the Committee on Overseas Affairs (Professor D. E. C. Mekie) moved: "That the Annual Report of Council under 'Overseas' be received."

He said that one-third of the members of the B.M.A. were overseas doctors and he would ask their representatives to speak for themselves.

Dr. J. ST. L. O'DEA (Republic of Ireland) said that Irish doctors also had their problems. Only about 35% of the population received a full comprehensive medical service. However, in various ways 93% of the population received some form of subvention or assistance from the State. The objective in Southern Ireland was to keep their own association active and alert so that it could deal with the problems that could arise. "I am glad of this opportunity," added Dr. O'Dea, "to acknowledge the debt which the Irish Medical Association owes to the British Medical Association. Over many years you have come to our assistance and you have always been available when we wanted advice."

Dr. LUFFINGHAM introduced the following representatives from overseas: Dr. E. A. MOSES (Trinidad and Tobago Medical Association); Dr. R. M. H. MALONE (Barbados); Dr. V. R. PATEL (Kenya Medical Association); Dr. J. ST. L. O'DEA, Dr. M. A. KEHOE, and Dr. N. REILLY (Republic of Ireland); and Dr. R. SCHRAM (Uganda Medical Association).

Constitution of Committee

Dr. LUFFINGHAM moved that the constitution of the Committee on Overseas Affairs be amended as follows to consist of: (1) The four Chief Officers of the Association. (2) Four members elected by the Representative Body. (3) Four members elected by the Council. (4) Nine members appointed by Council after consultation with Branches overseas. (5) Power to co-opt up to six additional members. (6) Cross-representation from other B.M.A. Committees where appropriate.

The motion was carried by the necessary majority.

Dr. LUFFINGHAM formally moved: "(1) That the policy laid down in 1919 on the inclusion of salary details in advertisements submitted for publication in the *British Medical Journal* be waived in respect of advertisements from overseas; (2) that a suitable notice should appear in the Overseas classified advertisements section of the *British Medical Journal* advising all applicants to make inquiry as to remuneration and terms of service before accepting any overseas appointment."

Dr. E. A. MOSES (Trinidad and Tobago) moved an amendment that after the word "overseas" in (1) should be added "but Council shall be authorized to reintroduce the requirement for any particular Commonwealth country if so requested by the Branch or national Medical Association directly concerned."

He said the doctors in Trinidad and Tobago viewed the decision to exclude the publication of salary details in advertisements submitted to the *B.M.J.* with some disappointment. Unlike some of the larger Commonwealth countries, the conditions of service and salaries in the Caribbean area were not as good as in the United Kingdom. Salaries differed from island to island. In some cases it depended on whether the applicant was of British birth or not. Many applicants might be misled into accepting posts which they found to be different from what they had originally bargained for. Until such time as their Governments offered conditions similar to those in the United Kingdom every effort should be made to acquaint every prospective applicant with as much detail on conditions of service, including salaries, as possible. To that end the Trinidad and Tobago Branch of the British Medical Association was prepared to supply prospective applicants with details of any posts advertised.

Dr. R. M. H. MALONE (Barbados) said that publication of salary scales in the *B.M.J.* was the only method of watching Government scales of pay. It would be disastrous if rates of pay in various countries were available only to applicants of posts in the countries concerned. Overseas rates of pay were bad, and the B.M.A. should maintain careful scrutiny both at home and abroad. He added that Barbados had decided to remain a Branch of the B.M.A.

Dr. LUFFINGHAM welcomed the fact that these representatives had taken the trouble to bring this matter before the Representative Body, and he accepted the amendment.

The motion was carried, as amended, with the necessary majority.

Dr. LUFFINGHAM reported that on 1 July the New Zealand Branch of the B.M.A. had become independent. He hoped that a telegram from the Representative Body would be sent congratulating the New Zealand Branch on achieving independent status and wishing it well.

This was agreed to.

Service by Retired Doctors

Dr. R. L. CORMIE (Glasgow) moved a motion: "That this Meeting proposes that Council inquires into the desirability of setting up a system whereby retired but fit doctors might give the benefit of their services, for a period, in the developing countries which are short of medical manpower, and report back to the A.R.M. in 1968, preferably with an already functioning scheme."

He said there were many countries where the number of doctors was inadequate. Malawi, for instance, had about one doctor per 50,000 persons. This was likely to continue for many years. Many medical schools had special links with areas of need—Glasgow with Nairobi and Edinburgh with Baroda (India), and so on. To those areas registrars and consultants had been seconded for varying periods, commonly up to one year. That, however, met with only a small part of the need.

There were many doctors in Britain who, when they retired from the N.H.S., were still fit and able. He believed some of them would be willing to give their services to necessitous areas for periods of three, six, or 12 months, or even longer, either as practising doctors or in an advisory capacity. Since they would be in receipt of a pension, they would not expect much more than their living and travelling expenses—presumably to be paid largely by the countries where they worked. "This would lessen the financial problem of the scheme," he said. The doctors would probably have to have insurance cover for illness, injury, and medical defence.

Not every underdeveloped country would wish to participate in such a scheme, and also there might be many initial difficulties to overcome. None the less, it was an idea worth investigating.

Dr. RONALD GIBSON said he would accept the motion on behalf of Council.

General Medical Services (Resumed Debate)

Practice Premises (Continued)

Dr. J. N. REDFERN (East Yorkshire) moved: "That, with reference to paragraph 25 of the Annual Report of Council, general practitioners who choose to practise from health centres should not be subject to pressures, direct or indirect, to receive remuneration by way of salary."

He said the point of the motion was to ensure that no general practitioner was forced to accept payment by salary because he was entering a health centre when other doctors in it had opted for payment by salary or because the Minister had chosen that health centre as one of the pilot areas for payment by salary. It was not a motion to discuss the advantages or disadvantages of payment by salary but a motion against the principle of coercion or pressure. This situation had occurred in his area, and doctors were unable to obtain a satisfactory answer from the Ministry.

Dr. CAMERON asked the Meeting to support the motion. It was true the Ministry was not in a position to give an answer, because the matter had not yet come under discussion with the representatives of the profession. The profession would never agree to any set-up which would deny the right of a doctor to choose the system of remuneration under which he wanted to work.

The motion was carried.

Service Committee Procedure

Dr. T. GARDNER (Cumberland) moved: "That this Meeting supports the G.M.S. Committee in its efforts to implement the proposals included in the third report on the reform of the service committee procedure."

He said that three years before, when the profession had determined to rid itself of some of the most oppressive aspects of the service, service committee procedure had been high on the list of items demanding urgent and radical reform. The system had engendered over a long period of time a sense of injustice and bitterness, for the Ministry had been unprepared to do anything about it.

The profession had won the right to renegotiate a new system. The profession had been presented with proposals which would, in the first place, abolish the multiplicity of badly constructed committees of amateur jurists and replace them by a small number of well-qualified chairmen of unquestionable competence and integrity appointed by the Minister. After consultation with the Lord Chancellor and the G.M.S. Committee doctors were now offered a system of conciliation which would leave in the hands of executive councils the job they could do best—to try to help patients, who wrongly imagined themselves to have a grievance, to understand the facts and to relieve their minds of the sense of bitterness or injustice which they might harbour. If this was impossible the service committee would become necessary.

In 1965 there had been over 700 complaints; half had been dismissed but half had gone to service committee hearings. In the end 38 doctors had had sums withheld from their remuneration. Fifty in a 100 had been brought before service committees.

Dr. F. E. GOULD (Birmingham) said that the G.M.S. Committee was moving in the right direction, but he did not support the details of the report. He was opposed to the conciliation procedure: it was unnecessary. It should continue, as now, to be done by the clerk of the executive council. The idea of appointing a lay person to assist the clerk was that he should be "a person of standing, with the requisite qualities of tact and sympathy." It might be very difficult to find a lay member of the executive council with those qualities. He hoped the G.M.S. Committee would continue on the lines of improving the procedure, but some details left much to be desired.

Dr. C. J. WELLS (Sheffield) reminded the Representative Body of the nursery rhyme: "When she was good she was very very good, but when she was bad she was horrid." This applied also to some medical service committees. It was an emotive subject. Those who were locally involved in the problem were perhaps unwilling to relinquish some of their authority. Their duty was to devise a scheme which would do the best for their colleagues. The proposals in the report were such that they would perhaps produce a uniformity and some form of control which would ensure that all doctors, and those patients who brought the complaints, had just and proper treatment.

Some Satisfied

Dr. M. R. SHERIDAN (North Middlesex) said it was of vital importance that the Representative Body should accept the motion. The previous speaker had spoken about overall uniformity that was required in service committee procedures in England and Wales. At the present time there were some executive councils and some service committees who said, "We have the finest service committee in the country and we do not want it interfered with." He compared this attitude with that of perhaps a magistrates' court, but there were many people who would rather take their chance at quarter sessions where they had a legally qualified chairman to dispense justice for them.

The Charter had called for an overhaul of the disciplinary committee. A magnificent scheme had been produced. Even if there were a prima facie case, a legally qualified chairman could give a doctor an absolute discharge without asking for a hearing because, though it might be a prima facie case, it was not enough to bring the doctor before what some might call the "star chamber," and cause him the anxiety of going through an inquiry only to be told it was a technical breach.

Dr. W. F. JONES (Liverpool) moved the following amendment: "That in any change in service committee procedure those areas who wish to keep the status quo should be permitted to do so."

He said that it was conceded that changes should be made, particularly in rural and semi-rural areas, and also in some minor matters, but in Liverpool and other large areas justice was already done to doctor and patient. That had been proved in practice, not in theory. Local experience was that in many cases the matter could be satisfactorily settled on a common-sense basis. A legally qualified chairman might be bound by his legal training and tend to make the hearing too formal. Three local medical men and three local laymen with their knowledge of conditions and people were more likely to arrive at a just solution for both sides. On the question of time, it was more convenient to travel a few miles than spend time travelling to a regional centre. Liverpool believed it was better to amend the existing method than support wholesale changes, and, where the existing method worked, it should continue.

Dr. N. G. NICHOLSON (South Middlesex) said that once again Liverpool had gone on record as trying to contract out of what was generally good for the country. The number of those unfortunate enough to be brought before the service committees went up every year, yet the number found to be in breach of service remained almost static—proving that the number of trivia brought before the service committees was going up. The Executive Councils Association had gone on record as saying that the existing system worked well and should be retained. That was not the profession's opinion.

Cases of Injustice

Dr. R. B. L. RIDGE (Council) said the object in the reform of service committee procedure was to secure the best procedure to ensure that no doctor was submitted to the ordeal even of the preliminary correspondence phase of service committee procedure, let alone the ordeal of the actual hearing, when it was not necessary. Even in some of the areas most outspoken in favour of retaining the status quo the saddest cases of miscarriage of injustice occurred. It was extremely difficult to judge the efficiency of one's own system when one was involved in it.

Dr. GOULD (Birmingham) said it was difficult to support the G.M.S. Committee in its effort to improve the medical service procedure and to agree entirely with the way it was going about it. He was not satisfied that the majority of local medical committees desired a change of procedure—on the contrary, he thought they would wish the present procedure to continue.

Dr. **OUTWIN** (Council) urged the Meeting, whatever its feeling on the motion, not to support the amendments if for no other reason than that they were badly phrased. As Dr. Gould had said, a large number of service committees were perfectly satisfied with the job they were doing, even if they were not doing a good job.

Dr. D. **BROWN** (Liverpool) said that from his own long experience of medical service cases he was certain reforms were necessary. Often the most satisfactory inquiries were those conducted in the smaller areas, where the local knowledge was greatest. If it was desirable the small areas could be retained, and if certain areas felt there had been an injustice they might want to go into bigger areas.

Dr. **GARDNER** said that, in spite of the satisfaction that had been expressed by several representatives with the present procedure, the system remained a pernicious one. If it was to be changed it must be changed for the whole country. After an uproar of protest throughout all the years of the National Health Service, with requests for reform of the Service, at last there was an opportunity to reform it. The reforms were sensible, good, and right. The reform suggested, although it might not be perfect, was an enormous step forward in the right direction.

Dr. J. W. **DIGNAN** (Stratford) asked what had been the conclusion at the Conference of Local Medical Committees ?

Dr. **CAMERON** replied that the Conference had referred that part of the report back for reconsideration by the G.M.S. Committee.

Dr. **JONES**, in reply, said that local medical committees must surely decide for themselves. Let the existing system be retained where it worked rather than make uniform arrangements for the whole country.

The amendment was lost.

Further Amendment

Dr. D. F. **HEATH** (Birmingham) moved the following amendment: " That this Meeting considers that medical service case procedure and method of appointment remain as at present, preferably with a legally qualified chairman."

Dr. Heath said the Birmingham Division did not wish to hinder the normal development of the medical service procedure, but it thought that regionalization would be a retrograde step. What support was there for regionalization ? The Executive Councils Association had circularized 119 areas asking them for the opinion of their local medical committees on regionalization. Of the 100 replies received 60 had been against regionalization, 12 for it, and 28 had expressed no opinion.

There was a tendency to blame service committee and tribunal regulations for not working well when the blame lay with the doctors for not seeing that it worked. Some said the lay members and chairmen were not well informed. It was the doctor's business to see that they were. Others said that a basic principle of justice was that those sitting in judgement should be completely independent and that a doctor should be able to count on getting justice. " What an indictment of the medical profession and all our friends who do this work for us," said Dr. Heath. The right of appointment of medical service committees and the right to appoint a chairman should be retained. Who wanted a chairman appointed by the Minister or the Lord Chancellor ?

In Birmingham in 1965–6 22 complaints had been dealt with by the medical service committee without a single hearing. In 1966–7 of 29 complaints 27 had been dismissed without a hearing, one had been withdrawn owing to retirement, and one appeared before the medical service committee and a suitable recommendation was made.

The informal handling of complaints took place already in many areas where doctors had taken an active part in working with and gaining the confidence of the lay members of the executive council and had chosen a chairman wisely. In that case Dr. Heath advocated if possible a legally qualified chairman. If the desire was to hand over control to the Minister or the legal profession the Meeting should accept the proposals in the third report and the recommendations of the Council and the G.M.S. Committee. But if the wish was to retain independence and look after the profession's own affairs the Meeting should reject regionalization and continue with the present regulations with amendments as necessary.

Dr. **RIDGE** (Council) told the Meeting of one area where the chairman of the service committee had decided that in every complaint where a death was concerned there would be a hearing. That was wrong. There were grounds for a hearing only when prima facie there was a breach of the terms of service. If the chairmen were to be of the quality and calibre to take the right decision it would be difficult enough to find the 16 who would be required for the proposed regionalization—men in the legal profession of such a stature that their abilities were well known to the Lord Chancellor.

Dr. N. G. **NICHOLSON** (South Middlesex) said that the amendment sought to throw out the whole conciliatory machinery, and all the amendments should therefore be firmly rejected. Dr. **OUTWIN** (Council) said that the Meeting, having already rejected the amendment whose design was to preserve the status quo, would be doing virtually the same thing if it passed the present amendment. The word " preferably " in the proposed amendment meant that there was no obligation on any local service committee to have a legally qualified chairman.

Dr. **GARDNER**, in reply, once more appealed to the Meeting to throw out the amendment, to support Cumberland's resolution, and to enable progress to be made with reforming of the system.

Dr. A. **ELLIOTT** (Redbridge) said that the amendment contained in substance what the Conference of Local Medical Committees had said, and Dr. Elliott warned that in his own and many other areas of the country there would be a terrible outcry if the A.R.M. came to a different decision.

Dr. **HEATH** expressed amazement at the number of representatives who had wanted all the machinery put into the hands of the Minister and the legal profession. " Surely we want to retain something of our individuality ? "

The amendment was lost.

The motion was carried.

Complaint in Writing

Dr. J. P. **GRIER** (Plymouth) moved: " With reference to the service committee procedure, this Meeting recommends that when conciliation has failed and the complainant persists in pressing his complaint he should be required to formulate his complaint in writing in the form of an affidavit or sworn declaration before it can be submitted to the chairman of the service committee."

Dr. Grier said the suggestion put forward by the Plymouth Division was intended to apply only to those instances where clerks of the executive councils had failed to achieve conciliation. The idea of a sworn statement by the complainant had three valuable purposes. The first was to discourage frivolous complaints ; the second was to prevent a change of ground by the complainant at the hearing; and the third was to ensure that the practitioner had an opportunity to seek advice before the hearing.

Dr. D. R. **COOK** (Camden) moved the following amendment: " To delete all the words after " complaint " in the fourth line of the motion and add " either at a service committee or on appeal no hearing should be held if the complainant does not himself appear."

Dr. Cook gave several instances of hearings at which complainants had not appeared to substantiate what they had said. He believed that was a monstrous practice.

Dr. **GRIER** said that the amendment was not in any way related to the purpose and intention of his Division's motion and he hoped the Meeting would throw it out. Dr. **COOK** replied that he wanted a reform in medical procedure and he wanted to do it in an effective way. The motion would be quite ineffective.

The amendment was carried, and the motion, as amended, was then approved.

Representation of Complainant

Dr. **HEATH** (Birmingham) moved: " That this Meeting agrees that at an oral hearing by the Ministry of an appeal from a service committee recommendation the complainant should not be represented by an employee of the defendant's executive council."

Dr. Heath said that when a complainant or respondent appealed against a medical service committee recommendation the Minister, if he considered fit, convened an oral hearing. He appointed a legally qualified chairman, a Ministry doctor, and a representative of the profession—usually a member of the G.M.S. Committee—to hear the appeal. The doctor could present his own case or be legally represented, as could the complainant, but in the Ministry notes on procedure at appeals it was stated that when the appeal was by a practitioner against a decision in the complainant's favour the clerk to the executive council might be prepared to arrange with the complainant to open the case on his behalf and to cross-examine.

" We feel that for the clerk of the executive council to represent the complainant is highly undesirable on two counts. The clerk is the only one at the hearing, besides the parties concerned and their witnesses, who was present at the service committee hearing. Not only that but he arranged the service hearing and was present when the case was discussed by the members and the recommendation decided upon. We feel that it would be difficult for the clerk to be impartial. This procedure could lead to very bad feeling between the local doctors and the clerk."

Dr. Ridge (Council) said that this was not a new point. While at first sight it would appear that the suggestion was a good one, when the subcommittee looked into it it found that the procedure worked to the doctor's advantage. He hoped the Meeting would not take a decision on the motion.

Dr. Heath, in reply, said he disagreed with Dr. Ridge. It was highly undesirable that the clerk to the executive council should act in this way, and he suggested that the clerk to an executive council from another area should be brought in on these appeals.

The motion was passed as a reference to Council.

Rural Practice Dispensing

A motion standing in the name of Hexham, "that this Meeting deplores any alteration in the present arrangements for rural dispensing," was, by leave, withdrawn.

Dr. Gardner (Cumberland) moved: "That this Meeting considers the right of prescribing doctors not to dispense should be safeguarded."

He explained that the motion simply asked that the Minister's proposals for the establishment of areas within which all patients would be dispensed for should not be accepted, because this would mean that large numbers of doctors who had been practising in an area for a generation or more would suddenly find themselves having to dispense. This development must be resisted.

Dr. A. M. Rankin (Council) supported the motion—which was a corollary of the preservation of the right of the dispensing doctor to continue to dispense. The new system would be that the executive council would decide, in the light of circumstance and of opinion, whether or not a doctor would be required to dispense. This mainly affected rural practices, but it might in certain circumstances affect urban practitioners.

Dr. J. S. Happel (Chairman, Rural Practices Subcommittee) accepted the motion.

The motion was carried.

Dr. A. M. Maiden took the chair.

Dr. Gardner (Cumberland) moved: "That this Meeting proposes that Tariff dispensing should be continued."

He pointed out that if the proposals of the Ministry were accepted the many doctors who had been dispensing on the Tariff all through the years would lose that right. It might be necessary to make minor adjustments of the way in which they had dispensed on Tariff up to now, but the enormous majority had dispensed to their own satisfaction and for the good of their patients. If there were difficulties in Tariff dispensing it was wrong that the whole system of Tariff dispensing should be abolished in order to deal with these marginal difficulties.

Dr. H. B. Muir (Council) supported the motion. The Tariff method was the only ethical method. The capitation system would depend on the continuation of the Tariff system for its viability. It was necessary to have continuation of the Tariff system for the capitation doctor who found his capitation fee did not cover his expenses, through no fault of his own. He must therefore have an alternative. The only one was the present Tariff system structure with minor amendments.

Dr. J. W. Bland (Nuneaton) pointed out that a small group of dispensing doctors working in the mining villages would be severely handicapped by the present proposals put forward by the Minister. In such areas the demand for the services of the Welfare State was high. Doctors' costs were high. There was a range of costs from 20s. up to about 80s. per patient per year. They were being offered a capitation fee of 49s. The alternative was a very uneconomic system. There must be some system, such as the Tariff system, that bore relationship to the demand on the Service.

Dr. Happel explained that if it were only a question of negotiating a new dispensing capitation system a reasonable agreement would quickly be reached on the basis of the third report and subject to certain safeguards for the future. However, the negotiators were not satisfied on the right of a doctor to dispense. The main stumbling block was the Drug Tariff system. Some points of clarification had been raised on the new proposals, and a further reply from the Ministry was being studied. A memorandum was being drafted setting out what dispensing doctors would be prepared to accept. The G.M.S. Committee had authorized a special meeting of rural doctors in 1967. There was no intention of calling rural practitioners together until there was some important decision for them to take. If the talks were very long the meeting would be deferred until the spring if necessary.

The motion was carried.

The Meeting agreed to the withdrawal of a motion standing in the name of Dorset: "That, having regard to the fact that profits from dispensing and rural practice payments constitute financial subsidies for rural practice, the G.M.S. Committee be urged to ensure, in its negotiations with the Minister, that any reduction in the former should be offset by an equivalent increase in the latter, and in any case remuneration under either of these headings should be considered in relation to the other."

No Detriment Clause

Dr. J. R. Edwards (Exeter) moved: "That this Meeting instructs the Council to insist on a "no detriment" clause in the event of any change being made in rural practice dispensing arrangements."

He pointed out that the so-called profits on dispensing were in fact payments for work done. They were an integral part of the income of rural dispensing doctors and helped in part to compensate for smaller lists. Exeter sought to ensure that no doctor was out of pocket as a result and was not further discouraged from providing an essential service in rural areas.

Dr. M. McKendrick (Hexham) said that the motion expressed the rural practitioner's justifiable fear of the unknown. He was greatly concerned that his future should be adequately safeguarded in negotiations with the Minister.

Dr. G. Cormack (Newcastle upon Tyne) explained what the effect of a "no detriment" clause might be. In certain circumstances rural patients would be deprived of an enormous convenience in being able to obtain medicines from the doctor, and the dispensing doctor would possibly as a result suffer a grievous drop in income. The facility should not be withdrawn from patients. But if the facility was withdrawn from country patients, and dispensing doctors suffered a drop in income, they must be compensated, and there were well-recognized means of estimating what that compensation should be. It had to be done on an actuarial basis. That was the way to do it rather than to insert a blanket "no detriment" clause which might give rise to complications not foreseen in the motion.

Dr. E. Townsend (Cornwall) supported the motion. Negotiations with the Ministry on the dispensing issue were difficult. There was a fundamental contradiction in the approach. On the one hand doctors were constantly saying to the Minister that they were overworked, and on the other hand they said they still wanted to do dispensing. In his part of the world there were many rural practices which had been built up over many years on the understanding that dispensing was part of the job. Many doctors had been dispensing for a great number of years. These people would be hard hit if the proposed system was introduced.

Dr. Happel advised the Representative Body not to accept the motion. The negotiators were trying to get a capitation payment to achieve a fair level with proper safeguards. They were also trying to negotiate a satisfactory Tariff, especially for the high-cost-per-patient areas. They were trying to secure protection for the right of every doctor to dispense, and, if that should be lost, to see that there was proper compensation. In view of these assurances, he wondered whether the motion might be withdrawn.

Dr. Edwards, in reply, said that he had been specifically instructed to speak on behalf of rural practitioners. They were providing a service and that service should not be lost. If their profits disappeared he suspected that so would many of the rural doctors.

The motion was carried.

Approach to Women's Institute

Dr. J. D. Shapland (Plymouth) moved: "That this Meeting deplores as both dangerous and unethical the approach by the secretary of the Central National Health Service Chemists Contractors Committee to the secretaries of the branches of the Women's Institute on the subject of rural dispensing, and requests Council to take appropriate action."

He said that in June the annual general meeting of the Women's Institutes had been due to debate the subject of dispensing in rural areas. Some time in April the secretary of the National Health Service Chemists Contractors Committee had circularized a letter to all secretaries of the Women's Institutes. The contents of the letter were in strong terms and against dispensing doctors. He had not before heard of a similar attack widely published to a lay audience by a man or committee, presumably fairly highly placed in his profession, about a group of practitioners in an allied profession.

A copy of the letter had not been sent to the B.M.A. but had been discovered accidentally. It was the sort of behaviour the Representative Body should ask the Council to deplore and to take whatever action it thought appropriate.

Dr. HAPPEL said that immediate action had been taken to circulate a dignified disclaimer; it had been sent to Women's Institute branches everywhere and to dispensing doctors. The W.I. branches had deplored the document even more heartily than had Council, and had shown their views in no uncertain manner at the Royal Albert Hall. The B.M.A. had received a letter of support from the W.I., who were the largest rural "patients' organization."

The B.M.A. had a Joint Committee with the Pharmaceutical Society, and had had a recent meeting. The B.M.A. members of it had taken the opportunity to make clear to their opposite numbers their view on the memorandum. But it was important to keep a sense of proportion. The chemists had their points of view and their problems.

The motion asked Council to take appropriate action. That had already been done.

The motion was carried.

General Practitioners and the Hospital Service

Dr. D. F. HEATH (Birmingham) moved: "That this Meeting agrees that in the discussions on hospital medical staffing between the profession and the Ministry on remuneration and terms of service attaching to part-time appointments in medical assistant and clinical assistant grades, the commencing level of payment per session should be not less than £5 6s., as at present."

He said that discussions were taking place between the G.M.S. Committee, the Joint Consultants Committee, and the Ministry on remuneration and terms of service for part-time appointments in the medical assistant and clinical assistant grades. The proposals for the remuneration of these new posts were disturbing. Those doctors who had been working in hospitals for four years or longer, under Section 10B, retained the present scale of remuneration of £5 6s. In the new medical assistant grade, in which most doctors would work, there were proposals for them to start at £3 4s. 6d. per session, increasing by 3s. 6d. per year per session to a maximum, in 15 years, of £5 14s. It meant that it would take 12 years for the new post to be paid at the present rate. That was an absurd situation.

In the words of the draft hospital memorandum on part-time appointments in the medical assistant grade: "The grade will be mainly for general practitioners and other doctors outside the hospital service." If the hospitals wanted the assistance of general practitioners they had to make it attractive and not offer less than they were now receiving.

Dr. C. J. WELLS (Sheffield) asked the Representative Body to support the motion. Negotiations on the subject were in progress. Some months before the G.M.S. Committee had found the Ministry proposals to be quite unacceptable because they stated that a general practitioner working at the present time in the hospital service should continue his work at a lower rate of remuneration. The G.M.S. Committee had produced further proposals. These had been agreed in the main by their hospital colleagues, and a tripartite meeting had been held with representatives of the Joint Consultants Committee, the G.M.S. Committee, and the Ministry. Unfortunately, the proposals had not been acceptable to the Ministry, but it had them in mind and would be sending a reply in the near future. These proposals were in complete agreement with the present motion from Birmingham.

Dr. H. GLYN JONES (Bromley) asked the Representative Body to reject the motion. There was a grade in the hospital service which was a career grade of medical assistant. If general practitioners wished to go into the hospital service to work as medical assistants it was an unthinkable proposition that, because they were general practitioners, they should be paid a higher rate of remuneration than someone who was in a career post as a medical assistant in the hospital.

Dr. CAMERON said that there was agreement with their hospital colleagues on certain proposals put to the Ministry. The Committee was aware of the difficulty in merging the two services in the hospital, but it was not for it to say that, because the career structure in the hospital was at a certain level, it should ask general practitioners to accept that scale of remuneration.

The motion was carried.

The following three motions were moved formally by the CHAIRMAN and approved:

"That this A.R.M. considers that there is now some urgency in defining the place and status of the general practitioner in the hospital service, with particular regard to level of remuneration and terms and conditions of service." (Medway and Gravesend.)

"That the fees paid to doctors working in hospital as clinical assistants should be more commensurate with their worth." (Dewsbury.)

"That in negotiations concerning general practitioners working in the hospital service a clear distinction be made between (*a*) education appointments, (*b*) stand-by duties, and (*c*) work requiring special skill and experience, and that for each category an appropriate grading and remuneration should be obtained." (East Herts.)

Dr. W. H. N. ANGUS (Southampton) formally moved the following motion: "That this Meeting instructs Council to ensure that general practitioners with special experience holding part-time posts which are an essential part of hospital staffing structure should have security of tenure in these posts."

The motion was approved.

General-practitioner Hospital Beds

The following three motions were formally moved by the CHAIRMAN and carried:

"That this Meeting considers that the Minister of Health should make greater efforts to encourage the provision of general-practitioner beds." (Camden.) "That all hospitals of district hospital status and above, currently planned or to be built in the future, shall include general-practitioner maternity beds." (West Suffolk.) "That this Meeting is of the opinion that there should be general-practitioner beds in all new hospitals, and that the establishment should be determined at the earliest possible moment in the planning project." (Redbridge.)

Prescribing

Dr. R. G. TROUP (Havering) moved: "That this Meeting considers that the regulations prohibiting a doctor from issuing a prescription for a substance for the treatment of several members of a family suffering from the same illness should be relaxed."

He said that no doubt medical practitioners had their own solutions for this problem, but nevertheless within the ranks of general practitioners there were a few sticklers for the rule book, and unfortunately a great many sticklers for the rule book were on executive councils.

Dr. B. L. ALEXANDER (Manchester) said doctors were treating individual patients and not issuing block prescriptions. A second point was that their chemist colleagues were being rather harshly treated at the moment, having accepted a cut in pay for prescriptions, and they as doctors must protect their interests as the chemists would protect the doctors' interests if the need arose.

Dr. CAMERON said he was opposed to accepting the motion as a reference to the Council. He was certain that doctors could not prescribe for a family as such with a bottle of medicine in the bathroom cupboard and someone dishing it out when it was required.

The motion was, by leave, withdrawn by Dr. Troup.

Dr. A. N. MATHIAS took the chair.

Election

The Secretary announced that Dr. A. M. MAIDEN had been elected unopposed as Deputy Chairman of the Representative Body.

President-elect

The Meeting welcomed Mr. R. V. COOKE, the President-elect of the British Medical Association.

Therapeutic Abortion

Dr. RONALD GIBSON (Chairman of Council) moved: "That the Annual Report of Council under 'Therapeutic Abortion' (Doc. A.R.M. 2, para. 200) be received." This was agreed.

Dr. R. H. SCOTT (Norwich) wished to speak against reception of this part of the report. He thought that any further discussion of therapeutic abortion would be only delaying action. Any further delay in legislation was not in the public interest. Discussions had taken place on therapeutic abortion in Parliament, in the Representative Body, in the Church, and in the legal profession. Nearly the whole of the discussion had been held by the male sex. Surely this was something which was predominantly of interest to the female sex. He felt it was wrong that the Meeting should be adjudicating in a matter which was of prior importance to the female sex.

Dr. RONALD GIBSON said that there would be wide interest in the debate, and he thought that representatives should speak to the debate rather than accept the motion. The Medical Women's Federation had reported on the subject, and so had the vice-chairman of the Association's committee.

The Annual Report under Therapeutic Abortion was received.

Request for Royal Commission

Dr. M. SIM (Birmingham) moved: "That this Meeting asks that Council, in support of its resolution passed unanimously at the Annual Representative Meeting, Swansea, in 1965, requests all members in both Houses of Parliament not to approve legislation of the Medical Termination of Pregnancy Bill until all relevant facts have been collected, scrutinized, and reported on by an independent tribunal, such as a Royal Commission."

He said that the private member's Bill on abortion at present before Parliament had been given unprecedented support by the Government in defiance of the medical profession's opposition to some of its fundamental aspects. He did not intend to divide the Meeting by putting forward a partisan attitude to the Bill or to the subject of abortion. He would like to unite the Meeting by putting before them a motion which was fair to all. Representatives should not be side-tracked by quibbles about the wording of the A.R.M. resolution in 1965—its meaning was perfectly clear. Nor should they be lulled into a false sense of security in the hope that the Association would obtain concessions which had been denied to opponents of the Bill in the House.

To be fair to all doctors, said Dr. Sim, there must be a thorough examination of all the evidence by an independent tribunal, such as a Royal Commission. That this had not yet been done was a serious criticism of the manner in which the Medical Termination of Pregnancy Bill was being pushed through Parliament. Doctors did not wish to delay or to obstruct enlightened legislation. If the facts warranted it they would welcome reform, but it must be based on sound evidence and not on the slanted propaganda of mass media. No single doctor could collect all the necessary information. Even the B.M.A.'s special committee could deal with only one aspect. A comprehensive inquiry by a tribunal which commanded the respect of doctors and laymen alike was desperately needed. The motion had added importance, for the Government had just announced that it would give as much extra time as was required to get the Bill through. A strong vote in favour of an independent tribunal would have a profound influence in the country and indirectly on Parliament, and it was a stand which would be eminently defensible. This was the last real chance the profession had to influence the Bill in the House of Commons. Dr. Sim concluded: "Let us leave the country in no doubt that we doctors do not accept fundamental changes in our clinical practice without the fullest inquiry into the facts. Our patients would not wish it otherwise."

Dr. J. L. MCCALLUM (Westminster and Holborn) said that the profession had asked that the Council should set up a special Committee. This had been done. The Committee had investigated the situation and no new legislation had been introduced until the Committee had reported. Asking for a Royal Commission at this stage, when for over 30 years the findings of the Birkett Committee had not been implemented—which were exactly the same as the recommendations in the present Bill before Parliament—was quite absurd, said Dr. McCallum.

Intention and Result

Dr. D. HOOKER (Cornwall) said that doctors must be clear on the difference between the intentions of the Bill and its final interpretation; final interpretation would be abortion on demand with all the relevant facts and figures that followed it. Dr. Hooker quoted statistics of mortality and morbidity in Scandinavia and Hungary, and suggested that there had not been enough discussion of the experience of other countries.

Dr. J. S. HAPPEL (Winchester) said that when motions had been discussed and drafted in his Division it had seemed that the Bill was being rushed through before the B.M.A.'s views, as set out in its Special Committee's report, had been discussed in Parliament. What his Division had wanted was breathing space to get the necessary amendments through. Things had since changed for the better. Further Parliamentary time had been made available. There were still a few changes in the Bill that the Association would like to see, but the report stage had not yet been completed, and the Bill would then have to go to the Lords. There now seemed a chance of the Bill going through in a fairly acceptable form. When so much of the Association's policy had been accepted why turn back the clock by asking for a Royal Commission?

Dr. E. TOWNSEND (Cornwall) explained why he was speaking against Dr. Hooker. Dr. Hooker had spoken at the request of a small meeting of the Division (which had a membership of 280) where the voting had been 11 to 3 for the B.M.A. policy as outlined in the report of the Special Committee. He was sure that did not really represent the view of his colleagues, and that it was the same in many Divisions. The motion demanded delay, and yet, as they all knew, the social evil of abortion existed and had done for a long time. If you had money you could get an abortion, if you had no money you could not, said Dr. Townsend. There were many parts of the country where abortion or termination of pregnancy could be obtained normally through the channels of the N.H.S. This was already done in Aberdeen. Scottish law was slightly different. All the Bill was doing was legalizing the position in the rest of the country. This should not be delayed. There were safety clauses in the Bill.

Element of Politics

Dr. JEAN E. LAWRIE (Dartford) reminded representatives that the B.M.A.'s Special Committee, together with the Royal College of Obstetricians and Gynaecologists, had taken a great deal of trouble to put before Members of Parliament the points they wished amended in the Bill. If Members of Parliament rejected this careful and thoughtful advice consideration would need to be given to forming some other kind of advisory body to try to get across to Parliament the wishes of the medical profession.

If it was likely that the amendments which the B.M.A. wished to see in the Bill would be accepted she thought her Division would not press for the setting up of a Royal Commission or another body. However, there was an element of pure politics in the Bill. Women doctors would be more satisfied if they could see some genuine attempt by the Ministry to improve gynaecological departments so that there were no waiting-lists of six months—because the passage of the Bill could be expected to increase the pressure on these departments.

Dr. D. R. WRIGHT (Thames Valley) said that abortion, together with sterilization and the use of contraceptives, was an integral part of family planning. Yet there were no provisions in the National Health or hospital service for a family planning service, although many hospitals leased their premises to the Family Planning Association. The Minister would be well advised to contemplate providing abortion and other family planning measures in a separate service. Gynaecologists with waiting lists would find their position intolerable. Sterilizations and abortions already occupied much of their time to the detriment of other routine and emergency work. The situation would worsen with the passing of the Bill. The Representative Body should encourage the House of Commons to stop and rethink.

Mr. E. COPE (Birmingham) said that as a gynaecologist he frequently performed therapeutic abortion on medical grounds under the protection of existing case law. He had been assured by senior members of the legal profession that it was very unlikely in the foreseeable future that the case law would be reversed. Mr. Cope told the Meeting about a thirteen-week abortion in his unit where the foetus had not been sectioned for several hours. When it was sectioned, the following morning, the heart was still beating. Was the baby to be registered or incinerated? In the near future it would be possible to hook up that sort of baby to an artificial placenta. The decision would then have to be made whether to drown it like a kitten or preserve its life. Until that and many allied matters had been discussed by an independent tribunal consisting of lay, legal, Church, and medical members, the law should not be ossified in its present form. (Applause.)

Extreme Views

Dr. D. L. WILLIAMS (Denbigh and East Flint) said the question of abortion had been bedevilled by the extreme views held both inside and outside the profession. Initially the Bill had been bad because it had been drafted by people with extreme views. It had then been extensively amended by people with opposite extreme views. That was not the way to go about such a serious piece of social legislation. The Government ought to have had the courage to consider and to introduce its own legislation. As a general practitioner he had never encountered any difficulty in referring a patient for abortion when he felt it was right.

He did not like the wording of the motion, but he did want further thought to be given to the Bill. He asked the Representative Body to support the motion.

Mr. T. F. Redman (Leeds) was also in favour of the Bill receiving further examination by a Royal Commission, because he thought that the Bill was going to be so watered-down that it would be useless. He could not understand why so many doctors were so adamant in clinging to medical indications for a termination instead of openly accepting a serious social dilemma as being a ground for therapeutic abortion. He had every respect for the doctor who said, "I will never perform an abortion," whether it be on religious or conscientious grounds, but once the Rubicon was crossed the argument was only on how strong the indication had to be. The majority of the so-called medical indications were social indications in disguise. He was not advocating abortion on request, but he wanted to get away from hypocrisy and humbug.

Dr. B. L. Alexander (Manchester) pleaded with the Meeting to try to divorce itself from the emotive side of the question. Representatives were in no doubt that the law required to be altered. They were trying to legalize the position, so that gynaecologists could perform an abortion without fear of prosecution. The Bill at present before Parliament should go through. The profession could then try to improve it in the future if it were necessary.

Mr. D. B. Brown (Mid Essex) said that in its present form the Bill provided that a pregnancy could be terminated if there was a risk to the patient's health or life. As Mr. Cope had said, that risk existed in every pregnancy and the wording should be altered to "substantial risk."

Dr. K. J. Sugden (St. Helens) said if the decision was put off this time he did not believe there would be any better proposals. Several speakers had said that when they felt there were medical reasons for an abortion they had no difficulty now in getting one done. On the basis of existing case law the chance of a doctor being prosecuted for an abortion on medical grounds was remote.

"Particularly what concerns me is this," said Dr. Sugden, "I have always held it to be one of the most important tenets of my medical practice that I should under no circumstances have the right to make a decision regarding life and death. This is clear in regard to euthanasia and I am equally certain it will apply if we have abortion on request or something of that sort. We must learn in this respect from Sweden, where in the past 10 years they have had three abortion Bills and they still have not got it right." Dr. Sugden concluded, "I do not think that we have this sorted out sufficiently to make a decision of this kind at this time."

Number of Modifications

Dr. Doris M. Odlum (Bournemouth) said she was a member of the special committee set up by the B.M.A. after the A.R.M. in Swansea in 1965. The decision of that meeting had not been as stated in the motion. It had been that a committee should be appointed by the B.M.A. to go into the matter and report. The special committee had held many meetings and had produced a report which had been published. It had taken an active part in trying to modify the original Bill and had succeeded in obtaining a number of modifications.

The special committee was unhappy about two points in the Bill being debated in the House of Commons. It thought that the practitioner who carries out the abortion should consult with somebody with special knowledge in the field and not just "another registered medical practitioner." It proposed to try to get this accepted.

The special committee also considered that the reference to "any existing children of the family" was unnecessary, because it was already covered, and as worded it was undesirable. With the rest the special committee was in general agreement. There was no question of any kind of abortion on demand. Discretion lay in the hands of the medical profession. The grounds specified could be determined only by medical men, and there could be no interference by politicians or anybody else. "We cannot see that the medical profession can have any objection to this Bill subject to one or two slight amendments," said Dr. Odlum. "The only ground on which we could object was that we did not want a Bill of any sort or kind. This is probably the best Bill that we shall ever get. We are hoping that you will agree and that you will permit us to go on with the negotiations."

If the motion was approved, Dr. Odlum went on, a tribunal would have to be established to discuss the matter at length and it would be some time before anything would be done. The profession had not the slightest idea what a Royal Commission would say. She had had sufficient knowledge of bodies of that kind to know that all sorts of evidence and opinions would be produced, so much so that the members would get more and more confused. Moreover, this would inevitably take two years at least. The position at the moment was as favourable as the profession could ever hope to have.

Fresh Points

Dr. E. E. Claxton (Dartford) said that it ought to be remembered that the B.M.A.'s special committee had not met since October 1966. Many fresh points had emerged in debate since that time. The matter was so serious that a Royal Commission should look into the motives of the many people who had supported the Bill and of those who opposed it.

Dr. C. P. Wallace (Council) said the question to be asked was whether what was before the House of Commons was a great social reform. "If it is, woe betide us if we stand in its way," said Dr. Wallace. Dr. Wallace said that if he could feel certain that the measure before the House would stop back-street abortions he would probably support it. However, he was not convinced that would be so. On the contrary, he believed they would go on and flourish with an increased demand for abortion.

Mr. J. Kyle (City of Aberdeen) said the main purpose of the motion seemed to be to ask for more time and more information—which, from time immemorial, had been favourite tactics for delaying reform. He reminded the A.R.M. that it was more than 30 years since Mr. Aleck Bourne had been prosecuted. "How much more time do we want," asked Mr. Kyle. Living, practising, and bringing up a teenage family in Aberdeen as he did, Mr. Kyle assured the Meeting that, even with its more liberal policy, Aberdeen had not become suicidal, it had not become deformed, delinquent, or depraved.

Miss Gladys M. Sandes (St. Marylebone) said she was convinced that the present measure would mean abortion virtually on demand. Her next point was that many doctors who had only 12 gynaecological beds would be left with an average of two beds for their ordinary patients when the abortions started to come in. Such doctors would then have to decide which patients were to be omitted from the list.

Dr. J. W. Dignan (Stratford) said the profession must make its voice heard on the principle of the right of the doctor to treat his patient how he or she thought fit. Parliament must not dictate to doctors how they should treat their patients. A Royal Commission would be welcomed by the majority of general practitioners. Many were frightened of the Bill because, like Dr. Dignan, they saw it would lead to abortion on demand. If a Royal Commission was set up tomorrow its findings could be published in 12 months' time.

Unworthy Imputations

Dr. A. W. Macara (Junior Members Forum) suggested that the arguments in support of the motion had in the main been emotional. Hard cases had been quoted. They made bad law. There had been unworthy imputations against the mover of the Bill in Parliament, which anyone who knew him could confidently refute. It had been suggested that the Bill would bring about abortion on demand. He suggested the reverse—that it would give an opportunity of proper selection of those cases where help ought to be offered. He suggested that a Royal Commission or any further investigation was not going to carry the subject one step further forward.

Mr. D. N. Menzies (Liverpool) said that many of those present believed that for abortion to be done safely it must be completed before the thirteenth week. This was incorrect. He personally had performed 54 abortions and expected to perform many more. He had seen the units in Prague where curettages were done before the thirteenth week. He assured representatives that abortion was safer from the 14th week onwards. It had been said that there was need for speed in passing the Bill. There was no need for speed.

Dr. Outwin (Council) commented on the great preponderance of men at the Meeting. If it had been the men who were having the babies a much more radical reform would have occurred many years ago.

Dr. Ronald Gibson said that he had a tremendous responsibility. He had not been a member of the special committee. Its chairman was not a member of the Representative Body, and therefore could not reply. Dr. Gibson said he did not propose to be emotional. He asked the Representative Body to be cold and calculating about this and to look at the facts.

In 1965 the A.R.M. had asked the B.M.A. to set up a special committee, which it had done. It had not asked for a Royal Commission. The A.R.M. had asked the Council to ask the Government not to introduce legislation, which it had not—the Bill was a private member's Bill—until the Committee had reported. The special committee's report had been published in the *British Medical Journal* on 2 July 1966. It had been available to members before the 1966 A.R.M. The Association had actively sought amendments to the present Bill on the basis of the special committee's report in consultation with the Royal College of Obstetricians and Gynaecologists. The Minister of Health and the Home Secretary had been seen on two occasions. Members of Parliament had been circularized and there had been press statements and letters in *The Times*. The B.M.A. had been active in supporting many amendments.

Firstly, the Association had played a part in securing that there should be two medical opinions. Secondly, in the elimination of social grounds for termination—the elimination of abortion on demand in fact. It had also helped to get eliminated the "well-being" ground for abortion and that concerned with environment, and that any nursing-home should serve as a place for abortion. What was left? What should the Association continue to press for? Dr. Gibson thought there were four things. Firstly, to ensure that the abortion was lawful only if carried out by or under the supervision of a registered medical practitioner of the required skill and status instead of any doctor. Secondly, to get removed the express indication in the Bill that pregnancy might be terminated if there was risk of injury to the health of any existing children of her family. Thirdly, to obtain a satisfactory amendment of the conscience clause. Fourthly, a satisfactory assurance that details of notifications required under the Act could be kept confidential.

Time Left

The Government had allowed extra time for the Bill to be debated. Therefore the Association had time for its extra work, and it could follow the Bill through the House of Lords if necessary.

What were the alternative courses before the Representative Body? Firstly, to continue to press for the remaining amendments that were needed. Secondly, to oppose the Bill completely and to apply for a Royal Commission. Dr. Sim had said when he opened the debate: "If we ask for an independent tribunal this will have a profound impact on Parliament." Indeed, he thought it would. The Representative Body was the parliament of the profession, and it was a responsible body. What would be the impact on Parliament if the profession asked it to abandon the Bill in favour of a Royal Commission? What would the image of the Association be? Would it not be thought to be showing lack of responsibility? That, he thought, was the impact such a decision would have on Parliament. He hoped that, having been responsible in the setting up of a special committee, the Representative Body would not vacillate now.

Dr. **Sim**, in reply, said that it was criminal to legislate or to encourage people to legislate when the answers were not known. Listening to the debate, it was obvious that there was much that representatives did not know. It was unfair for the special committee to claim that it had been successful in all these amendments. They had been fought tooth and nail, and the B.M.A. should not claim all the credit. If the motion was not passed by the Meeting those fighting the Bill would feel that the doctors did not want them to go on fighting any longer. It was an important issue. Most doctors wanted to know the truth. Those who were afraid to know the truth should declare their interest. Those who wanted to know the truth would say, "Let us get an independent inquiry into this."

The motion was lost by 274 votes to 98 votes.

The following motion, standing in the name of North Middlesex, was, by leave, withdrawn: "That this Meeting feels that the British Medical Association, in support of its resolution passed unanimously at the Annual Representative Meeting in Swansea, 1965, requests all members of both Houses of Parliament not to approve legislation on the medical termination of pregnancy until all relevant facts have been collected, scrutinized, and reported on by an independent tribunal."

The **Chairman of Council** moved: "That the remainder of the Annual Report of Council under 'Therapeutic Abortion' be approved."

The motion was carried.

General Medical Services Committee (Resumed)

Prescribing (Continued)

Dr. A. R. **Carmichael** (Guildford) moved: "That the form E.C.10A shall be introduced in England and Wales and should not be abolished in Scotland."

He explained that form E.C.10A, which existed in Scotland, gave the doctor the right to prescribe for himself a stock-list of items he required for use in his surgery.

Dr. Carmichael said that the form had encouraged good medicine in Scotland. It allowed a doctor to maintain at all times a properly equipped emergency bank.

Dr. J. S. **Ross** (Council) said he understood that the retention of E.C.10A in Scotland had meant a loss to doctors of 2d. on the capitation fee. If that happened to doctors in England and Wales he, as a Scotsman, would like to know the answer.

Dr. J. C. **Cameron**, Chairman of the G.M.S. Committee, paid tribute to Scottish colleagues for making a sacrifice of the 2d. fee, and congratulated them on keeping the door open on this matter. The G.M.S. Committee had been trying for years to get the Ministry to introduce E.C.10A in England. But it had been decided to do away with E.C.10A in Scotland and to introduce the system used in England and Wales. Dr. Cameron wondered whether the capitation fee would be reduced by 2d. if the form was introduced in England and Wales.

Dr. A. A. **Clark** (Dunbartonshire, Chairman of G.M.S. Committee, Scotland) asked the Representative Body to pass the motion unanimously. Scotland had had stock order forms since 1913. Doctors in England and Wales used to receive 5s. per 100 patients for the supply of drugs. On an average list that meant some £16 a year. How much of the new capitation fee was set aside by the Review Body for that purpose was unknown. But the sum of 5s. per 100 patients was quite inadequate, because in Scotland the average amount spent was not £16 but £55, and yet the prescribing in Scotland was more than in England. After prolonged negotiation the Department of Health in Edinburgh had agreed to retain form E.C.10A, but with a reduced capitation fee of 2d. The majority of Scottish general practitioners agreed with that decision. If the negotiators could persuade the Minstry that E.C.10A should be introduced throughout the country there would be no question of reduction.

The motion was carried.

Disposable Equipment

Dr. **Audrey M. F. Brook** (Liverpool) moved: "That as a means of improving the standard of general medical services the Ministry should make arrangements to supply a full range of disposable equipment for diagnosis and treatment."

Dr. Brook said that the Minister had offered to help general practitioners improve their standards of practice, and this was one field in which much could be done. Over the years the range of disposable equipment had increased enormously. There were now an increasing number of the more sophisticated slide tests. The use of disposable equipment was a great time-saver both for the doctor and for ancillary staff.

Dr. **Cameron** said the G.M.S. Committee had been to the Minister before about disposable equipment. The Ministry had agreed to distribute disposable syringes because it recognized that general practitioners had difficulties in sterilizing syringes. At present the Ministry's view on disposable equipment was that the doctor, as an independent contractor, should look after himself. But, said Dr. Cameron, the Ministry would pay for this in the end through the expenses part of general practitioners' remuneration, and he saw no reason why the Ministry should not supply a full range of disposable equipment.

The motion was carried.

Medical Records

It was agreed to add the following words to a motion by Havering: "and that there should be free distribution on request to doctors within the National Health Service."

Dr. R. G. **Troup** (Havering) then moved: "That this Meeting welcomes the discussions on medical record envelopes which are taking place and recommends that consideration should be given to the layout of the details on the front of the envelope. The Meeting welcomes the colour tagging system published by the Royal College of General Practitioners and considers that the envelope should be designed to accommodate this service, and that there should be free distribution on request to doctors within the National Health Service."

Dr. Troup said there had to be an improvement in the present record card in order to improve efficiency.

Dr. J. M. **Cane** (Dewsbury) said the work load would be easier as a result of the change-over to accurate and complete record-keeping. Reference to past records would be easier and it would improve the service to patients. He supported the motion, but it did not go far enough. Dr. Joyce E. Brooks (Southampton) also supported the motion.

The motion was carried.

Attachment of Nurses and Health Visitors to General Practices

Dr. E. H. J. Cotter (East Herts) moved: "That the terms 'district nurse attachment' and 'health visitor attachment' be restricted to full-time attachment only, and that part-time attachment be referred to as 'liaison.'"

He said that from time to time a trend developed which was welcomed by the majority but which appalled a few. Such a trend was the attachment of local authority district nurses and health visitors to general practitioners. This was a scheme that had to succeed, and though there were difficulties on both sides Dr. Cotter thought that it would be better to differentiate between full attachment schemes and less complete schemes put forward by some authorities.

Dr. C. D. L. Lycett (Public Health Service) agreed that the scheme had its difficulties. But he hoped the Meeting would reject the motion, because it was far too early to attempt to make fine distinctions and definitions. The best form of attachment might vary from area to area. The best criterion for attachment was that the health visitor or nurse should look after the same family as the general practitioner and work in close collaboration with him. He hoped rigid definitions would not be sought at the present time. "Liaison" was not an inappropriate term—it meant "part-time attachment" in a different context.

Dr. Cameron said the motion was the most light-hearted that had appeared on the order paper. He found it difficult to find out when an attachment became a liaison, or when a liaison became an attachment. There were all sorts of possibilities about these arrangements: "I wonder what is going on down in East Herts."

A motion that the question be now put was carried.

The motion was lost.

A motion standing in the name of Medway and Gravesend, "That this A.R.M. welcomes the increasing attachment of local authority paramedical personnel to general practitioners," was accepted, as was another by Medway and Gravesend, "That this A.R.M. considers there should be general practitioner representation, as of right, on all local health authority committees making these arrangements."

Fees for Dental Anaesthetics

A motion standing in the name of Winchester, "That this Meeting supports active efforts by the Council to increase the fees for dental anaesthetics," was accepted.

Dr. W. Ferguson (East Yorkshire) moved: "That, with reference to paragraph 41 of the Annual Report of Council, the minimum fee for dental anaesthesia is unrealistic and should be raised to two guineas, and that the cost of this should not be a charge on the dentist."

He said that in the recently published report by the Standing Medical and Dental Advisory Committee on Dental Anaesthesia it was emphasized that general anaesthesia for dentistry should not be undertaken lightly, and it classified the various groups of patients with dental conditions who were suitable for general anaesthesia. Dental surgery and anaesthesia could not be combined by one operator without some increased risk to the patient. Anaesthesia required the presence of either a consultant anaesthetist or a general practitioner. The present fee of 15s. as a minimum was grossly inadequate for the specialized work. East Yorkshire suggested that the fees should be raised to a minimum of two guineas, and the charge should not be on the dentist.

Dr. F. O. Wells (East Suffolk) moved an amendment that the words "at least" should be inserted before "two guineas."

The amendment was carried.

Dr. J. S. Noble (Council) supported the East Yorkshire motion. The importance of it lay not merely in the fee but in the superannuation attached to it.

Dr. Cameron said discussions were taking place with the Minister with the object of getting the fees paid through executive councils. They had been unable to agree a common policy with their dental colleagues, and dentists would make separate representations to the Ministry. Dr. Cameron asked the Representative Body to carry the motion.

The motion, as amended, was carried.

Survey of Practice Expenses

Dr. G. C. Price (Bournemouth) moved: "That this Body believes that the professional advisers to Council failed to understand the intentions of this Body in passing Resolution 260, A.R.M., 1965 (Annual Report of Council, 1967, para. 43) and instructs Council to seek the views of the Divisions concerned, Bournemouth and Morpeth."

He said the motion passed at the A.R.M., 1965, read: "That this A.R.M. considers it imperative that a suitable independent outside body conducts an impartial survey into the actual and concealed running costs of medical practice, both general and private consultant practice."

The motion had been rejected, but it was the view of his Division that the experts had failed to appreciate the purpose of it. That type of survey was not unique. He had with him a copy of a survey carried out for chartered accountants. An extract read: ". . . the information can be of immense value in promoting discussions as to practical steps to be taken by members to make their practice more efficient, to help them obtain proper remuneration for their services." A similar survey for the medical profession would help the negotiators by providing much-needed facts. The point of the motion was that it suggested that the Council should ask the Bournemouth Division to submit a memorandum which would explain in fuller detail the meaning and purpose of the motion.

Dr. Cameron said there had originally been an inaccuracy in the report the G.M.S. Committee had had from its advisers. Dr. Price had put his case moderately and he felt he would be churlish to advise rejection of the motion. He would be glad to have a memorandum on the subject from the two Divisions.

The motion was carried.

Work Load of General Practitioners

Dr. L. P. Grime (Junior Members Forum) moved: "That this Meeting instructs Council to negotiate simplified forms of a standard size, and at a uniform fee, not requiring the patient's signature, for use in all immunization procedures. A simplified form should also be introduced for cervical cytology."

Dr. Grime said the principle behind the motion was self-evident. It would improve efficiency by cutting out a lot of unnecessary paper work.

Dr. Cameron said he was prepared to accept the motion, but preferred that the fee should be one which measured up with the amount of work involved, rather than a uniform fee, as suggested in the motion.

Dr. A. M. Maiden took the Chair.

Dr. Cameron suggested that the words "realistic fee" should be substituted for the words "uniform fee," and the Meeting agreed.

The motion, as amended, was carried.

Dr. J. P. Fisher (Bournemouth) moved: "That a prescription on the form E.C.10 should be repeatable in the same way as any private prescription."

Dr. Fisher said that Bournemouth was attempting to reduce the work load.

Dr. Cameron said that what the motion proposed had been tried again and again, but there was great opposition from chemists because of the administrative work involved. Dr. Cameron promised to look into the matter again, but he did not hold out much hope of solving the difficulty.

The motion was carried.

Dr. J. C. Oakley (Medway and Gravesend) moved: "That this A.R.M. asks Council, in the light of the increasing work load in general practice, that list sizes be revised and lowered, without financial detriment, to figures beyond which no doctor be required to accept allocation of new patients."

Dr. Oakley said the time had now come to stipulate a maximum list beyond which doctors were not prepared to accept any further allocation, otherwise the standard of work would decrease.

The motion was carried.

Dr. M. Macleod (Wallasey) moved: "That, as the original aspirations of the Charter have not been achieved, an efficient service cannot be offered until the problems of work load, adequate time with the patient, and freedom from threats are solved."

The motion was carried.

A motion in the name of Cornwall, "That the Association seeks assurance from the Minister of Health that the agreement to accept responsibility for the general medical care of the population as a whole does not imply unlimited responsibility beyond what is practicable and possible," was, by leave, withdrawn.

Prescription Charge

Dr. N. Nelson (City of Dundee) moved: "That the Minister is mistaken in his view that a charge would not lessen the work load of the general practitioner, and this Meeting considers that a prescription charge is necessary to reduce the work load of the general practitioner."

Dr. Nelson said that a doctor in Dundee had done some research and produced figures to prove that the work load had increased. The results had indicated an increase of 0.6 items per patient owing to the withdrawal of the prescription charge and also a small increase in demand.

Dr. R. C. GREENBERG (Finchley) showed the Meeting a Yugoslav National Health Service prescription form which included a number of categories of patients—industrial workers, pensioners, holiday residents, and so on. The doctor indicated the appropriate category on the prescription form, and when the patient arrived at the chemist's the chemist referred to a book which told him the appropriate charge, if any, to make. That method had proved very effective.

The motion was carried.

Dr. F. G. TOMLINS (Waltham Forest) moved the following motion which had been reworded with the agreement of the Meeting: "That, with regard to paragraph 45 of the Annual Report of Council, this Meeting requests Council to devote further attention to the problem of work load in general practice."

Dr. Tomlins said that the matter of work load, particularly the lack of balance of supply and demand for medical services, was one of the most serious problems in medical practice today and one which was steadily worsening. He urged the Meeting to pass the motion so that the problem might be tackled with the urgency it deserved.

Dr. W. F. JONES (Liverpool) said he knew of no worth-while source of information on work load, and yet the Council still considered the time was not ripe for such a study. In his view the figures were essential now for evidence to the Review Body, and a start should be made in getting them.

Dr. C. C. LUTTON (East and Mid-Lothian) observed that the Annual Report of Council had stated that with the increasing shortage of medical manpower and a rising population which demanded more medical care, the profession faced a continuous increase in work. In his view the new remuneration structure had nothing to do with work load. The doctor's income was controlled, his work load was not. If that continued a new and terrible disease—"While I'm here, Doctor"—would be introduced, denying the really sick the treatment that they needed. It was therefore essential to employ work-study consultants to do a job analysis. It would cost money, but so did insurance policies. Doctors had nothing to hide.

Uttering "a word of warning" on the subject of work load, Dr. F. O. WELLS (East Suffolk) said that, whereas he was sure that all doctors thought their work load was excessive, the result of an investigation could be very misleading to the public. It would be better if the Meeting rejected the motion.

Dr. GILBERT R. SMITH (Council) said that two years ago he had resigned from the Health Service. Payments by patients did not influence work load at all. In fact, when patients were paying for their treatment there was even a tendency for the work load to increase. But the matter should be put in its proper perspective. There was no simple or easy way of reducing the work load of doctors. There was a population to care for and only a certain number of doctors. The work load had to be carried.

Dr. A. R. FOX (Waltham Forest) said in spite of a large number of suggestions to ease the work load the position had not changed materially. The Council should be asked to give further attention to this most important matter.

Dr. CAMERON said he was particularly interested in Liverpool's suggestion. The question of work load could not be considered until a final assessment of what it was had been made. There were no reliable statistics, but the Association was about to appoint an economist to its staff, and he would look into this question.

Replying to the debate, Dr. TOMLINS said Dr. Wells had said any investigation had to be done carefully, and for that reason he had suggested to the Meeting that it should vote against the motion. "We assume Council will do this carefully," added Dr. Tomlins.

The motion was carried.

Size of List

Dr. C. M. G. PEARSON (Tunbridge Wells) moved the following motion: "That this Representative Body believes that no general practitioner who has contracted to provide unrestricted medical services should be obliged or forced to accept a greater number of patients on his list than he feels he can provide an adequate medical service for in the light of his own health and the circumstances of his life and practice."

He said his Division was concerned with the changes that could take place in the nature of a doctor's practice without the doctor being able to control them. He was aware that the motion brought in echoes of the 100% issue discussed so thoroughly the previous day. With the decline in the general practitioners' strength, and the increase in the size of the population, general practitioners in some areas were allotted a large number of patients to them by the so-called block allocation. Whatever the reason, the doctor might find quite suddenly that the whole character of his practice, the size of his list, and the type of medicine he had been accustomed to practise had been changed overnight. The only person who could decide the amount of additional work he was able to do was the general practitioner himself, said Dr. Pearson.

Dr. CAMERON said that in recent years doctors had been increasingly anxious about block allocations. The G.M.S. Committee was negotiating with the Ministry on the subject. The motion gave guiding principles for these negotiations. Originally there had been considerable latitude in the kind of schemes to be operated over the country, and each executive council had had its particular scheme. By and large over the years there had not been great hardship to doctors. Block allocations were something that the G.M.S. Committee intended to resist.

The motion was carried.

Vocational Training and Continuing Education

The following two motions were adopted: "That the criteria for grants for prevocational training be less rigidly applied for those already in practice." (Mid-Glamorgan.) "That, while definite criteria may be applied to new general practitioners, those already established in practice should be considered on their merits, and a date in the future should be fixed for the full implementation of these criteria." (Salisbury.)

Dr. H. GLYN JONES (Bromley) moved: "That the scope of vocational training allowances be widened in order to encourage recruitment of women practitioners to general practice."

He said a number of suggestions on this subject had been made, and he suggested the motion should be accepted as a reference to the Council.

Dr. JOAN CHAPPELL (Council) said that the Vocational Training Subcommittee of the G.M.S. Committee thought that the problem was not confined to general practitioners. The criteria listed in the "Red Book" were such that there were very few doctors who had been successful in their claim for vocational training allowances. What was wanted was flexibility, so that those who were established in practice could take such hospital training as they thought they should to enable them to qualify for an allowance. The idea was to raise the status of general practice.

Dr. CAMERON said if it helped he would accept the motion as a reference to the Council, and write to the Medical Women's Federation to find out what was the position.

The motion was approved as a reference to the Council.

The following motion by Liverpool was approved: "That in the light of the Report of the Joint Subcommittee on Dental Anaesthesia immediate steps be taken to increase the number of refresher courses in dental aanesthesia."

Departments of General Practice

Dr. H. STOLL (Camden) moved: "That when departments of general practice are being formed in teaching hospitals, then as a first step consultation should take place with local B.M.A. Divisions and Branches, the respective faculty of the Royal College of General Practitioners, and the local medical committee concerned."

He said that it was important that in these departments tutors, teachers, and professors should be people who were acquainted with general practice. The last persons in the world competent to judge who was the best man to go out as a general practitioner were some of the hospital consultants.

Dr. JOAN CHAPPELL said some work was already being done on this. By next year it was hoped that a report would be available for the A.R.M. Meanwhile she would welcome any possible liaison between the interested bodies.

Dr. J. S. NOBLE (Council) said these bodies were not going to be set up everywhere. General practitioners would often have to push in where they were not invited.

The motion was carried.

The following motion by Southampton was approved: "That the vocational training allowance be increased."

Dr. B. TAYLOR (Tower Hamlets) moved: "That this Meeting considers that locum fees should be paid for a doctor attending intensive postgraduate courses and a similar fee if a partner or colleague looks after the practice during his absence. In order that there should be an incentive to attend such courses this money should not come out of the basic practice allowance."

He said that doctors going for an intensive course and those taking a week-end course were treated in the same way. Some fee should be paid so that doctors would be encouraged to take the intensive courses.

Dr. D. H. Jones (Mid-Glamorgan) said if the Minister honestly wanted general practitioners to have the benefit of regular postgraduate courses why did he not reimburse them for the locum fees necessary to enable them to attend such courses instead of making it a charge on the basic practice allowance ?

Dr. Cameron said that if the Meeting voted in favour of the motion then it would mean that the A.R.M. would have to change its policy and go back to the old system. That system had been completely changed by the basic practice allowance. He thought it would be better to wait until itemization of the basic practice allowance was available. If the scheme ran for a year the Committee could go back again to the Minister and ask for a fresh look at the question.

The motion was, by leave, withdrawn by Dr. Taylor.

General-practitioner Maternity Services

Dr. D. Burrell (Winchester) moved: "That the choice of obstetric care for the individual patient should rest with the patient's family doctor and not with the decrees of hospital or other authorities."

He said there was an increasing tendency for regional hospital boards and hospital management committees to lay down rules about which obstetric patients might or might not be dealt with by general-practitioner units. The same went to some extent for local authorities in connexion with home confinements. True, the 1958 perinatal mortality survey had been an extremely valuable exercise, and the recommendations of the Royal College of Obstetricians and Gynaecologists, based on that survey, were also helpful. But when these recommendations were used as absolute criteria that was quite a different thing. When patients corresponded to slide-rule or computer classifications many doctors would be able to take their pensions. But until then the only person who could decide what was best for the patient was her family doctor.

Dr. H. S. Howie Wood (Isle of Wight) said that the Meeting had already stressed the importance of general practitioners having maternity beds at their disposal. He was certain that the Meeting should press that there should be general-practitioner maternity beds in every district hospital.

Mr. D. B. Brown (Mid-Essex) said that he did not like the words in the motion "not with the decrees of hospital or other authorities." He proposed the substitution of "in close consultation and harmony with the consultant obstetrician."

The proposal was accepted. The amendment was carried, and the motion, as amended, was also approved.

A motion standing in the name of North Middlesex, "That this Meeting feels that the full fee for maternity medical services under the National Health Service Act should be in the region of £30," was adopted.

Certification

Dr. D. H. Jones (Mid-Glamorgan) moved: "That paragraph 49 of the Council's report is unsatisfactory, and that the B.M.A. should take immediate action to remove the responsibility of National Health Insurance certification for general practitioners."

He said that various solutions had been suggested, but a simple way would be the removal of the iniquitous National Insurance sickness certificate. This one stroke would eliminate a vast quantity of paperwork and enable the doctor to practise the art for which he had been trained. Patients should be able to declare the fact of their sickness. In the past misuse of certificates had been made, but he found it difficult to believe that a person would risk fine or imprisonment or both, as could be the case if the patient made such a declaration.

Dr. G. E. Crawford (Liverpool) said that this proposal was Association policy, passed at the A.R.M. in 1965. He maintained that if National Insurance certification were taken out of the general medical services the problem of the 100% issue and the work load would disappear rapidly. It would be of great benefit both to practitioners and to patients. It was time the Minister was told that the purpose of doctors was to care for the sick, not to be keepers of the public purse. That was the problem of the Ministry of Social Security, which should get on with it.

Dr. E. T. Griffiths (Monmouthshire) moved, as an amendment: "That Council be urged to continue pressure for removal of all National Health certification from the terms of service, but until this happens there should be a reasonable charge for each National Health insurance certificate to be paid by the Ministry and not by the patient."

Dr. E. C. E. Golden (York) opposed the amendment. The original motion was clear and unequivocal, he said.

Dr. Cameron hoped that the Meeting would reject the amendment and pass the motion. Dr. J. S. Noble also hoped the Meeting would reject the amendment. His only concern with the original motion was the question of the immediate steps. He liked the "continued pressure" in the amendment, but hoped that the Meeting would not settle for a fee.

The amendment was, by leave, withdrawn.

Declaration by Patient

Dr. W. R. King (North Glamorgan and Brecknock) moved, as an amendment: "That Form Med. 3 be abolished and replaced by a signed declaration of illness by the patient."

He pointed out that it was significant that the only three motions on certification on the agenda came from industrial South Wales, where the work load was the heaviest in the country and where certification played a large part in making it so. A signed declaration by the patient would do nothing to deter the genuinely ill from claiming what they were rightfully entitled to, but might work as a deterrent to the malingerer, who might think twice before he put his own name to a declaration that he was suffering from something he had not got.

Dr. M. Goodman (Liverpool) said that the Ministry of Social Security should be prepared to accept the word of the patient.

Dr. Cameron agreed that a form of affirmation seemed a sound alternative, but he would prefer to get on with the main motion.

Dr. King, in reply, pointed out that a case was always strengthened if a suitable alternative could be put. This scheme was already in use in certain countries in Europe.

The amendment was lost.

Dr. E. C. E. Golden (York) said that in Holland general practitioners were not allowed to issue certificates for their own patients, it being held that he could not be impartial. Certification was done by certifying doctors. He was not aware that there was more industrial absenteeism in Holland than in Britain.

Dr. Cameron said that some progress had been made in the last two years in the matter of certification. The Association's representatives had, after the Swansea meeting, seen the National Insurance Advisory Council. He thought that the time had come to be up and doing again. The motion asked for immediate action. He could give that assurance, but could not promise immediate results.

The motion was carried.

Renewal of Surgical Appliances

A motion standing in the name of North Devon, "That renewal of surgical appliances shall be permitted in any case where the patient has been using such a support for one year or more," was, by leave, withdrawn.

Dr. A. N. Mathias resumed the chair.

Remainder of Report under "General Medical Services"

Dr. Cameron moved: "That the remainder of the Annual Report of Council under 'General Medical Services' be approved."

He thanked Dr. Walter Hedgcock Dr. Peter Wilson, and Dr. A. Gilmour, who had just joined the team, and Mr. R. C. Barker and the clerical staff for their work for the G.M.S. Committee during the year.

Fee for Cervical Cytology

Dr. J. A. Sadler (Cambridge) moved: "That this Meeting considers that there should not be any lowest age limit at which a fee is payable for taking a cervical smear, and that a fee should be payable for repeated examinations every three years or earlier where there are clinical or pathological indications for doing so."

He said that the profession surely agreed that it was essential that cervical cytology must be available to all those at risk. Why, then, had the Minister of Health chosen an arbitrary age limit for payment of 35 years and over ? In Cambridge the University Department of Pathology, in association with the Cancer Research Bureau, kept a record of cervical smears done in the area. In 16 months between October 1965 and January 1967 10,878 smears had been taken. Of these, 4,755 (43%) related to women under 35 years of age. Of smears taken in the under-35-years group six showed carcinoma-in-situ present. An equal number was shown in the larger 57% over-35-years group. What was the reasoning for the Minister's figure of 35 years ?

Why was there no fee for the under-35-years group ? The figures he had quoted showed the under-35 group to be at equal, if not greater, risk. Did the Minister by paying for cervical smears for the over-35 group wish to discourage doctors from taking smears from the younger group? Maybe the answer lay in the *Supplement* of the *British Medical Journal* of 8 July. He saw in the reference to cervical cytology that further correspondence had taken place with the Ministry concerning lack of trained staff and technicians, which was preventing extension of the service. "But this arbitrary figure of 35 years is nonsense," concluded Dr. Sadler.

Dr. HARVEY GORDON (Kingston-upon-Thames) said it would be "a very reasonable and progressive motion" if it had age 25 instead of the "lowest age." There were limited resources available and they should be channelled to where they would achieve the maximum effect.

The motion was carried.

Transport of Patients

Dr. H. D. LEGGATT (Oxford) moved: "That the Minister be urged to review immediately the whole problem of transporting ambulant patients to their doctors' surgeries."

The CHAIRMAN said there was an amendment that the words "including the use of public ambulance services for this purpose" should be added after the last word of the motion.

Dr. J. H. MARKS (Barnet) spoke of the claim that doctors had insufficient time for their real work, and yet they wasted hours driving round the countryside doing unnecessary visits. Nowhere else in the world was this waste of a doctor's valuable time tolerated. In North America the average family had at least one car. In Britain those in the greatest need of medical care, such as the elderly and the poorest families, were least likely to have a car. That had already been shown by the number of elderly and chronic sick who would come to surgery provided they could have transport and would not be kept waiting. He believed that function should be taken over by the public ambulance service. The provision of transport for ambulant patients would improve the medical service for the public.

The amendment was agreed.

The motion, as amended, was carried.

Periodic Medical Examinations

Dr. C. M. G. PEARSON (Tunbridge Wells) moved: "That in view of the increasing public interest in periodic medical examinations the Representative Body proposes that a doctor should be at liberty to provide this, if requested by the patient, and to charge a fee for this additional service."

He said it was not uncommon for a patient to approach his general practitioner with the request that he be given a "check-up." There was often good reason for it, such as a proposed change of employment, marriage, or when the patient believed, or had been persuaded by reading a magazine to believe, that it was a wise and prudent precaution to have a periodic, routine medical examination.

His view was that such examinations did not come within the terms and conditions of general practitioners providing general medical services. The principle was already clearly established in examinations for life assurance, driving public service vehicles, and so on, where there was a separate fee.

Dr. CAMERON said the Association had been trying hard to get what was asked for. The Minister had not objected to an additional charge for check-ups, but he could not agree that the fee should be paid by the patient. It was difficult to differentiate between the kind of examination which the patient should have within the provisions of general medical services and the sort of check-up which was so fashionable today.

The motion was carried.

Motions on Other Subjects

A motion standing in the name of Plymouth, "That this Meeting urges that Selective Employment Tax for medically qualified and registered assistants and deputies in general practice should be reimbursed," was accepted.

A motion standing in the name of Camden, "That maternity allowances for principals and assistants of suitable seniority should be paid to women, as is the practice in the Civil Service and universities," was, by leave, withdrawn.

A motion standing in the name of South Bedfordshire, "That all postage paid by general practitioners for communications required by the Executive Council should be refunded, and this Meeting wishes Council to discuss this matter with the appropriate authority," was accepted.

A motion standing in the name of Exeter, "That this Meeting accepts the apology of the Chairman of the General Medical Services Committee for the mistake in the wording of E.C.N.569 and instructs Council to ensure that in future all E.C.N.s are checked in detail by the Association's professional advisers before being agreed," was, by leave, withdrawn.

Allocation Scheme

Dr. D. V. CASHMAN (Tyneside) moved: "That assignment of patients under the Allocation Scheme is not acceptable to the profession and that no doctor under his terms of service be required to accept a patient on his N.H.S. list except by free agreement between doctor and patient."

Dr. Cashman said that in a "National Health Service Note" of 1962 it had been stated: "Freedom of choice remains for both patient and doctor." That was not true. Freedom of choice remained for the patient but not for the doctor. There were patients who were ruining the family doctor service, and they were the patients whom the family doctor found that he was not free to refuse admission to his list. It had been said that to revoke that part of the allocation scheme would create difficulties for the Minister. That was wrong. The difficulties were there already.

A document had been circulated in March 1965 which had promised a revision of the terms of service and of the existing unsatisfactory allocation scheme. Doctors were still waiting for the negotiators to take an unyielding stand in demanding radical revision of the allocation scheme. The revision should include the unconditional right of any doctor to accept or decline to accept a patient in the same way as that patient had the right to select or reject a particular doctor. That freedom would be a tool with which to fashion a better family doctor service.

Dr. JOAN K. SUTHERLAND (City of Edinburgh) supported the motion because she felt very strongly that there was a most important principle involved. The possible injustices in the present position were highlighted in relation to the situation of the woman general practitioner. Many women who supplied general medical services wished to limit their responsibilities and number of patients to a load which they knew they could carry efficiently. The regulations relating to patterns for allocation schemes suggested that exemption could be sought by doctors, but the only grounds mentioned were age and ill-health. The Meeting had to establish an important principle—namely, that a professional person like a doctor should be in a position to limit his responsibility to what his conscience dictated.

Dr. B. D. MORGAN WILLIAMS (South Warwickshire) said that doctors had to be protected against objectionable patients.

Dr. CAMERON said he had touched on the subject earlier. It meant a revision of the allocation scheme. As a general rule, compulsory allocation was not used. He knew the difficulties of the troublesome patient, and in a rural area that could be most irksome. He had great sympathy with those doctors who encountered such difficulties.

He asked the Representative Body to leave things as they were. Provided the allocation scheme was worked with care then he thought the Association would finally reach a solution which would be satisfactory to the profession as a whole.

Dr. CASHMAN, in reply, said he knew it was a difficult problem. If the Meeting believed, as he did, that only a truly free profession could save family doctoring in the country it would say "yes" to the motion.

The motion was carried.

Finance

Dr. S. WAND (Treasurer) moved on behalf of the Council: "That the Annual Report of Council under 'Finance' (Doc. A.R.M. 2, paras. 166–170) and the Financial Statements (Appendix XIV and Doc. A.R.M. 3) be received."

He said that 1966, the subject of the balance sheet before the Meeting, was the first year of the increased subscription. The Association had expected that the increased subscription would produce £77,000. In the event it had proved to be £99,000. In addition increased rents and dividends, £9,000 net after tax, gave a total of £108,000 additional money.

The Meeting would want to know what had become of the money, because there had been mention of the economies that had had to be made in the light of decisions made this year and in the past.

In 1965 the Association had already overspent £40,000 on the secretarial account, and this continued in 1966. In addition, in 1966 there had been promised staff salary increases of £18,000; selective employment tax of £3,000; increased subsistence over part of the year of £2,000; increase in postage costs of £1,000; an increase of National Insurance of £1,000; and, after the Review Body's report, legal expenses, postage, printing, and extra editions of *B.M.A. News*, costing another £15,000. By the end of 1966

£80,000 had already been spent of the new money that had come from the increased rents, dividends, and subscriptions. The increases in subscriptions were expected to last a number of years. In 1967 the Association hoped to have a further increase in dividends and rents, but there would be a full year of selective employment tax, which was going to cost a further £7,000; staff salary increases would cost another £5,000; the forward planning unit would cost £9,000; and a full year of the increased subsistences another £6,000, making a total of £27,000.

Everyone knew and agreed that the Association had to advance and expand. It had been agreed that money should be spent on decentralization and regionalization. More money might have to be found, but the Association could not go on finding more money indefinitely at the existing subscription rate.

In 1966, and again this year, the Finance Committee had had to get the budget estimates revised, because the secretarial account showed an excess of income over expenditure of only £2,000 out of half a million pounds, without allowing for contingencies. The revision in the Budget had increased the £2,000 to only £6,000. Additional expenses were always occurring. A staff appointment had to be made recently. A few weeks before there had been an announcement about an increase in National Insurance stamps which would cost £2,000 a year, and there might be further increases.

Dr. Wand paid a tribute to the staff for the way in which they had co-operated in staying within the Budget. The Association was constantly looking for economies. It was moving much closer to computerization. It was a little difficult to arrange, but it would save money.

What were the financial objects? Clearly money had to be found and used to the best advantage, said Dr. Wand. Reserves had to be prepared to make provision for abnormal expenditure. A subscription increase had to be avoided as long as possible. With the present rate of expenditure and income there was a strong likelihood of a deficit on the secretarial account of anything up to £15,000 or £20,000 in 1968. The profits on the *British Medical Journal* publications must be used to build up a reserve. The *B.M.J.* was a successful commercial undertaking, but it was exposed to all the risks of commerce. It was competing in a competitive field.

A sinking-fund policy in respect of Tavistock House had come to an end in 1966. It appeared as a capital increase on paper because the money was shown as the premiums that had been paid from year to year over a long period, and the ultimate sum was greater. That had been invested as soon as it had come in. The value of the holdings in the balance sheet was now about £7,000 greater than as shown at 31 December, and was in excess of the cost.

One of the items debated at the Junior Members Forum had been the subscription. It had been made clear that it was the wish of junior members to pay as much as they were able to pay. A motion had been moved, and had received quite a lot of support, to add one guinea to the members' subscription for medico-political purposes.

Dr. Wand paid a tribute to the late Dr. Kate Harrower, who had been Deputy Treasurer of the General Medical Services Defence Trust, and to the Chief Accountant.

Revenue Budget for 1967

Dr. R. P. HENDRY (Rugby) moved: "That this Meeting notes the estates surplus for 1966 was £73,127 and the estimate for 1967 is only £47,520; it calls for an explanation of the anticipated reduction of over £25,000."

Dr. Hendry said that since the motion had been tabled he had received an explanation from the Treasurer of the reduction which was, apparently, merely the difference brought about after tax had been deducted.

The motion was, by leave, withdrawn.

On the motion of the Treasurer the remainder of the Annual Report of Council under "Finance" was approved.

Detailed Balance Sheet

Dr. D. C. ROBERTS (Hendon) moved: "That this Meeting requests that in future the detailed balance sheet annually available to the Representative Body shall be published in the Annual Report of Council."

Dr. Roberts said it would help in the compilation of motions if the detailed balance sheet was in future available to Divisions. However, it seemed undesirable for this information to appear in the Annual Report of Council where it could be read by everybody, and an undertaking had been given that it would in some way be made available to Divisions.

Dr. WAND said he was prepared to accept the motion as a reference to the Council.

The motion was carried as a reference to the Council.

Estates

Dr. WAND moved: "That the Annual Report of Council under "Estates" (Doc. A.R.M. 2, paras. 171–173) be received."

He reminded the Meeting firstly that the B.M.A. had a great deal of property to be maintained, and secondly that though the Association occupied a large part of B.M.A. House in Tavistock Square it also had a big property business. It was hoped the property income in the near future would be round £135,000. Contrary to some other types of office space, the accommodation in B.M.A. House was fully let.

The motion was carried.

The Annual Report of Council under "Estates" was approved.

Compensation and Superannuation

Dr. J. B. S. MORGAN (Chairman of Compensation and Superannuation Committee) moved: "That the Annual Report of Council under 'Compensation and Superannuation (Doc. A.R.C. 2, paras. 55–69) be received.'"

On 15 December 1966 new Regulations had come into force bringing a number of improvements to the National Health Service Superannuation Scheme, said Dr. Morgan. The improvements were the result of protracted negotiations over a number of years and now was an opportune moment to pay tribute to the hard and skilful work that Dr. Mathias had performed in his capacity as chairman of the Compensation and Superannuation Committee for 13 years.

The Editor of the *B.M.J.* had printed an account of the changes made in the new regulations and advice on their interpretation in the *British Medical Journal* of 10 December 1966. Dr. Morgan commended members to read that issue, but if further interpretation was required Dr. Peter Wilson, Assistant Secretary, would be pleased to help.

While an advance had been made on the superannuation front, much remained to be done for family doctors and also for hospital doctors and those in the public health service. Many doctors who had worked in general practice under the National Insurance Act and in voluntary hospitals for little or no pay had shouldered the responsibility and toil of those days and yet had no reckonable service to cover that period. That was an injustice that the State should be called on to repair, said Dr. Morgan. Doctors who had qualified and entered the Service after 1948 would ultimately have all their service reckonable. At a time of high taxation and inflationary spirals it was essential that the practice in other professional bodies in Britain and in other countries should be examined. If the Meeting expressed such views the Committee would be encouraged to soldier on to try to persuade the superannuation division of the Ministry of Health that further concessions must be granted. Finally, Dr. Morgan thanked Dr. Peter Wilson for all his help and guidance during the year.

Compensation

Dr. I. E. JAMESON (Salisbury) moved: "That this Meeting would like to see that the rate of interest on practice compensation is tied to the rate the Government sees fit to charge for loans through the Finance Corporation."

Dr. Jameson said that the time had come when the rate of interest received on the Association's compensation money should be related to the rate of interest the Association would have to pay for any money that it borrowed from the new Finance Corporation, and urged the Meeting to support the motion.

Dr. MORGAN said that the Committee had decided to include in its approach to the Ministry a request for an increase in the rate of interest, currently 2¾%. The rate of interest charged by the General Practice Finance Corporation was 7¼%.

The difficulties in negotiating an increase in the rate of interest were highlighted in the Third Report of Joint Discussions on the Family Doctor Service, in which the Government pointed out that the arrangements for interest at the rate of 2¾% (and no interest would have been earned by the goodwill had the right to sell it been retained) had formed part of a "once-for-all" settlement with the profession at the beginning of the National Health Service, and had been freely accepted at that time by both sides.

There was also the point made in 1964 by the then Minister of Health, Mr. A. Barber, that any increase in the rate of interest on medical practice compensation would have widespread repercussions on the rates of interest laid down for those shareholders who were compensated when various industries were nationalized.

Dr. JAMESON said that had doctors retained their right to compensation obviously the value of their capital over the years would have increased.

The motion was carried.

Superannuation Regulations

A motion standing in the name of Winchester, " That an independent trust be established to invest National Health Service Superannuation contributions on a realistic basis," was, by leave, withdrawn.

Dr. DAVID BROWN (Liverpool) moved: " That superannuated doctors' pensions should be continuously modified by a cost-of-living factor."

He said that superannuated doctors included those who had served Britain in two wars, who had practised during the decade of the worst depression the country had ever known, who had suffered the economic injustices of the early days of the National Health Service, who had been subjected to compensation with paltry interest, and had seen the capital value of the compensation sadly eroded. He urged the meeting to pass the motion, so that the B.M.A. could combine with other bodies in the public service to get the cost-of-living factor included in legislation. This was done in Common Market countries as well as Commonwealth countries.

Dr. MORGAN said he hoped the motion would be unanimously passed.

The motion was carried.

Dr. F. G. TOMLINS (Waltham Forest) moved: " That this Meeting, while recognizing the efforts of Council in this matter, regret the refusal of the Minister of Health to make satisfactory retrospective adjustment of superannuation contributions to compensate for the effects of inflation."

He said that it should be simple to rectify this by a factor which was fairly easily worked out.

Dr. MORGAN said that this motion was on the right lines and would be pressed.

The motion was carried.

Dr. W. P. LAMBIE (Sheffield) formally moved: " That this A.R.M. recognizes the real progress made by the Compensation and Superannuation Committee in the last year in wresting from the Ministry the concessions as laid out in the Report of Council. While justice to general practitioners had not yet been fully done, this A.R.M. acknowledges the advances made in that direction and congratulates the Chairman and his Committee on its interim success."

Dr. G. E. OWEN WILLIAMS (C.C. and S. Committee) supported the motion, and it was carried.

Superannuation on Part-time Appointments

Dr. E. T. GRIFFITHS (Monmouthshire) moved: " That Council be requested to ensure that all sources of income from Government departments be superannuable, comparable to the N.H.S."

He pointed out that for certain sources of income such as hospital sessions doctors did not get any superannuation. This was an injustice to single-handed practitioners with small lists who supplemented these by doing hospital sessions.

Dr. MORGAN said that the matter would be pressed with the Ministry but he was not hopeful.

The motion was carried.

The CHAIRMAN formally moved a motion standing in the name of Cardiff: " That doctors who had opted out of the superannuation scheme be now given the opportunity to opt in as from April 1967, such a step being fully in the spirit of the new forms of payment under the Family Doctor Charter."

Dr. MORGAN said that the matter was dealt with in the Annual Report.

A motion to pass to next business was carried by the necessary majority.

Dr. MORGAN moved: " That the remainder of the Annual Report of Council under ' Compensation and Superannuation ' be approved."

The motion was carried.

Superannuation Fund

Dr. GRIFFITHS (Monmouthshire) moved, "That Council be asked to press for the National Health Service Superannuation Scheme to be funded."

He said that £400m. of doctors' money was being held in a notional fund. There were 3,600 doctors over 65 years of age getting no pension and continuing to work. He therefore asked that the Council should press for this notional fund to become an actual fund.

Dr. MORGAN said that, unlike local government superannuation, the National Health Scheme was not funded. All contributions went to the Exchequer, which guaranteed to pay the benefits when they fell due out of general taxation. There were arguments for and against the question of investment. In 1953 the Government had appointed a Committee under the chairmanship of Sir Thomas Phillips to consider the " economic and financial problems of the provision for old age." Dr. Morgan quoted a passage from the report advocating funding for superannuation schemes.

Though this would seem to indicate that there was little or no objection to funding an investment of superannuation schemes, the Meeting must remember that the Ministry had pinpointed a number of difficulties when, in January 1966, the Committee had proposed the setting up of a separate, fully invested fund for practitioners' superannuation. The Committee's representatives had been informed that it was most unlikely that such a proposal could be accepted. At that time it had been said there were objections in principle to the proposal, and, moreover, there would be no guarantee—especially if there was a period of sharp inflation—that the fund would be adequate to meet benefits. Though local authority superannuation schemes were funded and many authorities invested their assets in equities and property, the benefits provided were no higher than those under the National Health Service Scheme, and indeed deficiencies arose which had to be met by the employer. If notional rates were realistic there was no practical difference between a notional fund and one that was actually invested.

Dr. BURRELL said that despite what Dr. Morgan had said it must be remembered that £400m. of doctors' money was invested with the Government. Why not have it for their own superannuation ?

The motion was carried.

Phased Retirement

Mr. MYLES GIBSON (Leeds) moved, " That as it seems likely the work load of doctors in the National Health Service will not appreciably diminish, and expecting the doctor's taking day-to-day responsibilities for his patients, while economic factors suggest large sections of the community may enjoy a shorter working week, the Superannuation Committee be asked to examine the possibility that doctors might in the future have the option to retire at a phased earlier age while retaining full pension rights."

Dr. MORGAN said that the National Association of Local Government Officers and the Conference of Local Medical Committees has passed motions on the lines of that proposed by Mr. Gibson, and if the Representative Body would do the same it would help in negotiations.

The motion was carried.

Occupational Health

Dr. J. C. MCMASTER, on behalf of the Chairman of the Occupational Health Committee (Dr. R. E. W. Fisher) moved: " That the Annual Report of Council under ' Occupational Health ' (Doc. A.R.M. 2, paras. 98–105) be received."

He said the Council had now to report that discussions had been concluded with the National Coal Board on the pay of doctors in its employ, and a joint approach had been made to the Ministry of Power. The implementation in this case involved the introduction of an increase on the old scales backdated to 1 October 1966, and the introduction of completely new scales to meet the total reorganization of the Coal Board medical service, which became effective on 26 March 1967. The new organization completely altered the relationship of medical officers to senior medical officers, who were now roughly on equality. That made considerable difference to career earnings. Discussions were still continuing with other nationalized industries.

The Association had completed its evidence to a committee on the care of the health of hospital staffs. It should be published within the next six months. The Royal College of Nursing had left the B.M.A. in no doubt that nurses were not at all satisfied with the existing provisions for the staff of hospitals.

The motion was passed.

Food Hygiene in Industrial Canteens

Dr. MCMASTER moved: " That all canteen staff should be examined from a hygiene point of view before employment, the type of examination to be determined by the medical officer in charge."

He said the motion was on something which had arisen in 1966. He was sure everyone would agree it was a sensible motion.

Dr. F. G. TOMLINS (Waltham Forest) moved the amendment that the words " handling food " should be inserted for the motion to read: " That all canteen staff handling food should be examined. . . ."

He said he was moving the amendment because it was thought the wording of the motion was too wide. It involved a certain waste of medical manpower in examining people who would never handle food.

The amendment was agreed.

The motion, as amended, was carried.

Dr. MCMASTER moved: " That the remainer of the Annual Report of Council under ' Occupational Health ' be approved."

The motion was carried.

The Meeting adjourned at 6.20 p.m.

Third Day: Saturday, 8 July

The Meeting resumed at 9 a.m., with Dr. A. N. MATHIAS in the chair.

Organization

Dr. J. S. NOBLE (Chairman of the Organization Committee) moved: "That the Annual Report of Council under "Organization Committee" (Doc. A.R.M. 2, paras. 206–224), the Amendments of Articles and By-laws (Appendix XIII), and the revised Report on the Constitution of the Association (Doc. A.R.M. 8) be received."

He said that a stiff increase in subscription, the troubles of junior hospital doctors—to say nothing of the wage freeze and the constant attacks of detractors of the B.M.A.—might have been expected to have had an adverse effect on membership. There had been a drop, but it was almost entirely accounted for by the loss of members to overseas Branches who had become independent and equal partners in the Commonwealth Medical Association.

The drop was nothing compared to previous falls in membership associated with rises in subscription. However, 70% was not enough and a membership drive was called for. Every non-member must be contacted personally, said Dr. Noble, and it was the duty of every member of the Representative Body to see that members in the Divisions did what they could to bring new members into the fold.

The B.M.A. was doing many new things for its members. It had had the offer of a comprehensive and efficient discount service from Independent Medical Services Ltd. There were also hire purchase arrangements that would help younger members. Another thing the B.M.A. had done for younger members was to introduce a personal careers advice service. Any young doctor could obtain a folder that dealt with career prospects, and so on. The introduction of other facilities, such as accountancy advice research and audio-visual and forward planning units, showed that last year the B.M.A. was neither wanting nor wasting.

Dr. Noble went on to say that the Representative Body should show it could respond to modern needs by enacting the constitutional changes agreed at Exeter. Last year it had been decided that the Association must have a smaller Representative Body, geographically and proportionately representative of the profession. This would lead to a rationalization of the relationship between the Representative Body and the Council on the one hand and the major sectional committees on the other. The latter would have domestic autonomy and the Representative Body would normally receive their reports and use the reference back in case of doubt and where there was dispute. That would free the Representative Body for more debating time on major issues and ensure that in matters of doubt those who were best informed decided. The individual doctor would have his say and any decision reached would be based on the full authority of the profession. The Representative Body would at all times retain the legal right to decide any issue on its merits.

In accepting the constitution report, the A.R.M. of 1966 had made certain amendments. It had expressed concern at the grouping of Divisions and at the inflation of the representation of minority groups. It had also been disturbed about proportional representation on the one hand—which it did not like—and at the same time it had called for proportional representation of hospital junior staff. It had accepted the idea of regional councils but had said (wisely, he thought) that they should be introduced only in a few years and on an experimental basis.

Previous Resolutions

The resolutions passed by the A.R.M. in relation to the Council (in respect of proportional representation and retaining regional representation) had led to a larger Council once more. It also meant the Council members attending the Representative Body—which made it more difficult to reduce its size. But that was in accordance with the wishes of the Association. The recommendations about the Representative Body had swung back the proposals a long way in favour of single constituencies. As had been suggested at Exeter, the recommendations loaded the more rural areas against the conurbations, but he believed that the electoral procedure for minority groups in the conurbations would to a large extent redress the balance. The Committee had gone as far as it could to achieve proportional representation. The document on the subject merely asked that members would be from each section of the profession, hospital, general practice, and others, according to the size of the constituency, with the exception of the large constituency and the allowance for the hospital junior staff.

There were many ways that those objectives could be achieved. The Organization Committee, by a large majority, believed that the present proposals were the best way to achieve them. Dr. R. P. Hendry, an invaluable member of the Committee, believed another way was equally good. Dr. Hendry would be putting his scheme to the Meeting.

"I come now to some matters on which I may be asked for an explanation," went on Dr. Noble. "Motion 310 requests us to explain the figures given in relation to the size of the new Representative Body. As we have said, these figures are only estimates, and they are subject to variation. The decision of the Representative Body to elect the Council on a regional basis has automatically made the reduction of that body in size more difficult, and the exact calculation of the members of the Council not being members of the Representative Body is equally variable. There is a further variable in that the retiring regional members of the Council are invited to the Representative Body, again enlarging it even more."

Another Variable

With the new constitution there was yet another variable. The non-voting committee chairmen on the Council would also be attending the Representative Body. They might be members of the Council, members of the Representative Body, or members of both. Any calculation about the size of the Representative Body must be an estimate. He believed that with all the variables taken into account East Yorkshire's figure [East Yorkshire Branch, movers of Motion 310] was a slight overestimate, and his forecast was that the reduction in size would be somewhere between the reduction in size forecast in the Constitution Report and that forecast by East Yorkshire.

In another motion, said Dr. Noble, he was asked to explain why the amendment to By-law 75 had been placed in the Appendix and not in the main Annual Report. The short answer was that there was no rule that laid down that recommendations for changes in the by-laws must appear in the main explanatory report. The Appendix was as much part of the Annual Report of Council as the main report itself.

Dr. Noble expressed his thanks to all those concerned with producing the report. The new constitution recognized the varying opinions within the Association. These had now been collated, and a flexible, fair method of representation produced ensuring that the minorities were heard, while the Divisions retained their place as the vital local unit. No constitution was perfect, and there would be anomalies, but the Committee had invited and received representations from Divisions on those. It had endeavoured to help every Division that had contacted them, said Dr. Noble, and he was satisfied with what had been done. The scheme was not sacrosanct, but he asked the Representative Body to give it a trial.

Dr. Noble concluded: "May I say that you have seen this meeting of the Representative Body labour under discussion of minutiae on matters that would have been better dealt with in committee. . . . We do not want to abolish debate in the Representative Body. We want to give the Representative Body the opportunity to speak for, and be seen to speak for, the whole profession on the weighty issues that face medicine in the future. Never has there been a greater need for co-ordinated leadership coupled with policy-making in strength. The Association ducked the challenge in 1957, and the task has been made the more difficult as a result. Failure to face the issues now may mean rejection for years, maybe for ever. I urge this Representative Body to take the decisions now that will enable us to go forward, acting for and leading the whole profession of medicine."

Subscription Rates

Mr. J. KYLE (City of Aberdeen) moved: "That the annual subscription of full-time lower-grade university medical teachers be reduced to 75% of the standard subscription."

Mr. Kyle said that the motion was put forward both to help non-professorial medical teachers and also to increase recruitment to the Association. The proposal was not a new idea; such rates had existed until about three years previously. The measure was not intended to be permanent, but to be effective until such time as the salary scales of the doctors involved were brought up to the level of clinical doctors. The non-professorial full-time university teachers were not a large group, though their numbers would probably increase more than those of any other section of the profession in the next few years if the Government's policy to increase the output of medical schools was implemented. Unfortunately, however, they were a bitterly disillusioned group. They felt that at a time when they were struggling, apparently hopelessly, to have their salary scales increased the Association had stabbed them in the back by withdrawing the concessional subscription rates. Acceptance of this motion would give back this concession.

Dr. J. S. Ross (Chairman of the Membership and Information Subcommittee of the Organization Committee) expressed sympathy with the full-time university teachers and other poorly paid doctors in their present financial difficulties. He said that it was most important that junior doctors should join the B.M.A. and stay in it. There was a tendency for doctors to leave the Association four or five years after qualification, though most doctors joined when they first qualified. It was too complicated to have a subscription ladder and a means test. All doctors must realize that they got value from membership of the Association, and no doctor could afford not to join. The Association could not afford to do its work properly without money, and would fail in its duty if it attempted to induce doctors into the Association by too low a subscription rate.

Dr. S. WAND (Treasurer) pointed out that the proposal would cost the Association £1,500 a year and there would certainly be repercussions in other fields. If subscriptions were lowered in one field, it meant that they had to be raised proportionally in others.

A motion that the question be now put was carried.

Mr. KYLE, in reply, said that he realized there were several privileged groups, but this was only reinstating a concession which was available up to a few years ago. He also realized that it might initially mean loss of income to the Association, but he did not think the Association could afford to fail to attract the many young graduates leaving medical schools.

The motion was carried as a reference to the Council.

Dr. J. M. CORALL (Medway and Gravesend) moved: "That on the payment of a fee of five guineas life membership of the British Medical Association should be granted to a member who had been a continuous subscriber for 40 years."

He said that his Division felt that after 40 years' continuous subscription one single, nominal sum should be accepted by the B.M.A. for life membership.

Dr. WAND said that this would cost the Association £8,000 a year. It could not afford it.

The motion was lost.

Constitution

Dr. W. F. DE C. VEALE (Brighton and Mid-Sussex) moved: "That immediate steps be taken to engage an independent firm of management consultants to examine and report on the whole structure of the B.M.A. before proceeding further with the proposed new constitution."

He said that his Division thought that the scheme at present before representatives had been prepared by people too near the trees to see the wood. The Division would like to know that the whole organization of the B.M.A. and its relation to the autonomous committees had been investigated, and would like the findings published in order to judge for itself. In 1953 a small committee led by Mr. H. H. Langston had drawn up a scheme which was virtually thrown out by the A.R.M. in 1957. The present scheme was only a rehash of the 1953 scheme. It had been prepared by the central hierarchy and put all the power into its hands. It put an extra barrier between the periphery and the centre. It put extra power into the hands of consultants, who would be able to veto general practitioners' wishes, and the A.R.M. would no longer be a policy-making body.

Dr. C. C. LUTTON (East and Mid-Lothian) opposed the resolution as being too late. If management consultants were brought in, it would probably be three to five years before the stage at which the Association was now was reached. The new constitution, if it went through, would have to be changed, and changed again. To stop at this stage would do harm.

Dr. WAND said that the Association had employed management consultants before, and that they had found few flaws in the manner in which the main Association's business was conducted.

Dr. H. L. LEAMING (Council) opposed the resolution because it would cost the Association a large number of members. Experts were needed on constitutional matters. He submitted that the Association had had them. The Solicitor, counsel when necessary, and the Board of Trade, all experts on constitutional matters, had advised the Association when necessary.

Dr. NOBLE asked the Meeting to reject the motion. The work of management consultants was management and consultation in business not in a free and voluntary organization representing a profession. Expert advice could be taken on internal administration but not in relation to the basic situation. Dr. Veale had inferred that consultants would be able to dominate the Representative Body; the constitution laid down that each section of the profession would have a fair say in the Representative Body. The constitution report stated that no section of the profession should dominate another by sheer numbers, and the Organization Committee stood by this statement.

Dr. VEALE, in reply, said outside advice should be taken. It would be money well spent. Referring to the proportion of consultants on the proposed new Representative Body, Dr. Veale said the scheme would allow for more than the original entitlement of 60.

The motion was lost.

Call for Reference Back

Dr. R. L. LUFFINGHAM (East Yorkshire) moved: "That, with reference to paragraph 208 of the Annual Report of Council, the Report on the Constitution of the B.M.A. (*Supplement*, 26 November 1966, p. 204) be referred back for further consideration in the light of the memorandum on the reform of the constitution of the Association, submitted for inclusion in the agenda for the A.R.M., 1967, by the East Yorkshire Branch, and that Council report back to the A.R.M. in 1968."

Dr. Luffingham said that the Constitution Committee had been set up in November 1963. East Yorkshire had set up its own subcommittee to look at the constitution of the Association a month later, and had informed the Association that it had been done. The Constitution Committee's report had then come before the Representative Body at Exeter. There had been no time or opportunity for East Yorkshire to be heard before that. The report had been discussed at Exeter, and, as a result of the proposals made at that meeting, a revised report had been published in November 1966. Once again it had been impossible for East Yorkshire to put anything forward, because the preamble to the document which had been published in the *B.M.J.* stated that "the Organization Committee would welcome comments, but the comments should be confined to constituency and boundary matters." Again general principles could not be discussed.

In February 1967 an offer had been made to all Divisions that the Chairman of the Organization Committee, or a deputy, should visit Divisions to explain the implications of the new constitution. East Yorkshire had written to the Association and had said, "We do not agree with the new scheme; may we put the opposite point of view?" The answer had been "No, you may not do that." Finally, East Yorkshire's views were made known through the *B.M.J.* on 3 June. It had been important that their proposals for reform should be published, so that, if there was debate and the revised constitution was turned down by the A.R.M., they would be in a position to say that here was a viable alternative which was worth investigating. Dr. Luffingham thought that if the resolution was passed discussion of the remainder of the motions on the Agenda dealing with changes in the constitution should be postponed. The last thing the East Yorkshire Branch wanted was that the constitution should not be discussed. What they wished to say was that here was a Branch who, four years before, had asked to be heard. If the promises that had been made to them then that they would be heard had been implemented the whole matter could have been settled. It was unfair that the Branch should be accused of delaying tactics and of wrecking the motions. They were not. The Representative Body had a further function over and above discussion, and that was its position as the last court of appeal for the aggrieved individual through his Division. East Yorkshire was an aggrieved Branch.

Previous Opportunities

Dr. J. S. ROSS (Council) said many had been disappointed when they had first seen the East Yorkshire memorandum appearing at such a late stage. Opportunities had been given to East Yorkshire representatives by the Organization Committee to meet and discuss the matter, but they had never been able to manage this. Criticism had been made the year before that there had not been time for discussion, but opportunities had been given to members to discuss the report in detail. The revised report had been published in the *B.M.J.* in November 1966. Further changes could be made to the constitution in future if necessary, but they could not afford to delay any longer if an efficient Association was to be formed.

Dr. C. C. LUTTON (East and Mid-Lothian) said time had been marked for long enough. The Association must go forward. There would never be complete agreement on the matter, but if a vote to proceed was passed the rest could come later.

Dr. H. L. LEAMING (Council) could see no advantages to be gained from the Council considering the memorandum. The urgency lay in implementing the revised Constitution. Until this happened the B.M.A. was in jeopardy. Another year's delay would be too long.

Dr. G. N. MARSH (Stockton), recalling past delays when the constitution was being considered, said that once more the motion, if carried, would stop progress. He welcomed the new constitution on two important matters of principles. Firstly, it embodied fair representation on the Representative Body and the Council so that those bodies would be composed of members of the whole profession from all areas, at all levels, and all ages; secondly, it avoided time-wasting duplication of medico-political affairs which had sapped the energies of the Association over the years.

Dr. R. L. LUFFINGHAM (East Yorkshire) asked what, if the motion were carried, the effect would be upon the discussion of the remaining business on the constitution. Would it not fall?

The CHAIRMAN did not share Dr. Luffingham's view. Other matters had been submitted by other Divisions for the Meeting's consideration and must be considered as well as E. Yorkshire's memorandum.

Dr. W. J. C. SCOTT (Dunbartonshire) regretted he could find no reference in the memorandum to regional councils or area health boards, which were, in his view, vital to the new constitution. Nor was there any mention of proportionate representation. Those were comparatively minor points. Others could be made more forcibly.

Mr. G. E. MOLONEY (Council) said that the Constitution Committee had gone to great trouble to arrive at its recommendations. There were things in the report that he himself did not like, but everyone could find something or other that was unpleasing. He urged the Meeting to give the new constitution a try and to modify it later if necessary.

Time Needed

Dr. A. V. RUSSELL (Council) strongly favoured East Yorkshire's motion. The doubts expressed in the East Yorkshire memorandum were also present in the minds of a good many of the Divisions. Though much time had been spent in considering the matter, even more time must be taken if necessary to reach as near perfection as possible.

Dr. G. R. OUTWIN (Council) said in his view the Association was trying to go far too fast in achieving the desired constitutional reforms. If the new constitution were put into full effect now the Association would be disrupted in every facet of its functioning at every level. That would be a grave mistake. It would be much better to do it by degrees.

Mr. H. H. LANGSTON (Council) urged the Meeting to reject the motion. The constitution now suggested was a vast improvement on what had previously been proposed. The Association could not afford to delay on the constitution any longer. He was constantly hearing from young consultants particularly, and not only hospital junior staff, that the Association did not fairly reflect the views of the body of the profession. If that continued, the divisive tendencies of which the Association was so afraid would mount and be difficult to contain.

East Yorkshire had put much work into its memorandum, but it was so different from the proposals of the Constitution Committee that he was certain that, even if the proposals were taken seriously, an answer would not be produced by next year.

Mr. M. J. GILKES (Brighton and Mid-Sussex) said Mr. Langston had stated that the Association could not afford to delay. In his view it could not afford not to delay. It was the duty of government to govern, but it was also the duty of government in a democracy, and the Association tried to be a democracy, to listen to opinion and to realize that there were an awful lot of people who were on the brink of departing from the Association. Nowhere in the debate so far had he heard any discussion of the merits of the East Yorkshire memorandum—merely that the Association must get on and could not afford to delay. He urged the Meeting to think about the matter very carefully indeed before taking a decision.

Heavy Weather

Dr. R. P. HENDRY (Rugby) suggested the Representative Body was making heavy weather of the matter. There were certain proposals it could get on with now, and during the year the East Yorkshire proposals could be studied. "Let us get on with some of the things we can get on with this year," he added.

Dr. R. COVE-SMITH (Council) said there were two points he wanted to make. Firstly, Mr. Langston had said that the dissatisfaction of hospital junior staff was due to the B.M.A., but it was mainly due to the defects in the constitution of the C.C. and S. Committee. Secondly, he thought the Association should proceed by evolution not revolution. Representatives knew only too well the effects produced on the medical profession by revolution from experience when Aneurin Bevan was bringing the N.H.S. into being. They were still suffering from that revolution. Evolution would have been much more effective.

Dr. RONALD GIBSON congratulated the Organization Committee and Dr. Noble in particular on the excellent report. He did not suggest that the new constitution was perfect. He could tear it to pieces and he could also add to it, but it had great merit, and Dr. Gibson asked the Representative Body not to block the scheme for a whole year.

Dr. NOBLE said that East Yorkshire should clear its own eyes before it asked the Representative Body to clear its eyes. He asked the Meeting to read through the East Yorkshire memorandum and the Constitution Committee's report at the same time. Who was guilty of glossing and who was being inaccurate? "They accuse us of wanting to abolish debate," declared Dr. Noble. "We are creating debate, and the anomalies in the Representative Body and the Council to which they have drawn our attention are largely the result of your own democratic decisions. I believe that if you will give this constitution a chance it will work. If you refer it back it will not work for years. I ask you to give this constitution a trial."

In replying, Dr. Luffingham said, "We may luff in East Yorkshire, but we do not huff and puff." (Laughter.) Some speakers had said, "Don't block the constitution," but he had not even begun to discuss the constitution. He was concerned with the reference back of the Constitution Committee's report and that only. An important constitutional issue was whether a Division or Branch had the right to make approaches to the Representative Body. East Yorkshire was asking the Representative Body to act as an appeal body.

Motion Defeated

The motion was lost, the vote being 159 in favour and 190 against.

A SPEAKER from the floor asked why the resolution required a two-thirds majority as it was not a change of policy of the Association.

The CHAIRMAN said it was a change of policy on the decision that the Meeting made last year. In any event, the motion had been lost on a simple majority.

Dr. K. W. BEETHAM (East Yorkshire) moved: "That, with reference to paragraph 208 of the Annual Report of Council, the Memorandum by the East Yorkshire Branch, entitled 'Proposals for Reform of the Constitution of the Association,' submitted for inclusion in the agenda of this Meeting, be referred to Council for consideration and report back at the A.R.M., 1968."

The motion, accepted by the Chairman of the Organization Committee, was carried with no dissentient votes.

Hospital Junior Doctors

At this point standing orders were, by leave of the Meeting, suspended to enable Mr. H. H. Langston to make what the CHAIRMAN described as an "important statement."

Mr. LANGSTON then read a statement about exchanges between the B.M.A. and the Junior Hospital Doctors' Association. This statement is printed at page 65.

President-Elect

The CHAIRMAN then introduced Mr. C. O. F. Rieger, of Adelaide, Australia, President-Elect for the year 1968–9. Mr. Rieger was accorded a standing ovation.

Mr. RIEGER said that he took it as a vote of confidence in the Australian Medical Association that his nomination had been approved. He pledged himself to follow the high tradition set by his predecessors and to uphold the dignity and honour of the profession, and promote the welfare of its members.

He urged as many members as possible to attend the Conjoint Meeting in Australia in 1968.

Organization: Constitution of the Association (Resumed Debate)

Sovereignty of Representative Body

Dr. C. P. WALLACE (Guildford) moved: "That notwithstanding any alterations made in the constitution, the Representative Body shall retain its sovereignty with regard to all matters concerning hospital, general practice, and the public health services, and will consider the reports from these bodies at each Annual Representative Meeting."

He said that if there were written into the constitution such statements as "the apparent conflict between the sovereignty of the Representative Body and the independence of the autonomous bodies," and "in all routine matters affecting sections of the profession we feel that the Representative Body would be satisfied if reports on the work of the autonomous bodies were submitted to it for information and not normally for detailed decisions," then it was essential that there should also be written into the constitution once and for all that if the Representative Body were to be worthy of its existence it must retain sovereignty in every section of the profession.

There would undoubtedly be cases which would seem to some people to be trivial and matters which should not be discussed at the A.R.M., but others that would appear to be matters of vital principle. It must not be made more difficult than it was at present to have such matters discussed at the A.R.M. He agreed that many of the motions which had been taken under the G.M.S. Committee report could adequately have been dealt with at the level of the G.M.S. Committee itself. On the other hand, there were innumerable matters concerning the three branches of the profession which concerned the profession as a whole and the great freedoms for which he hoped the Association still stood.

Dr. R. S. V. **Marshall** (South Staffs) agreed that the autonomous bodies should have a degree of autonomy in detail, but there was at present nothing to prevent them exercising their autonomy in matters of principle. The Representative Body must assert its position as the policy-making body. It would consult those bodies, but the present proposals put undue power into the hands of outside bodies.

Dr. G. N. **Marsh** (Stockton) said that the motion required the Representative Body to consider detailed reports from the Public Health, the C.C. and S., and the G.M.S. Committees so that it could reassure itself that all the right decisions had been made. That would be a scandalous waste of time, and would perpetuate the "crazy duplication" under the existing constitution.

Dr. J. C. **McMaster** (Council) said that splinter groups could not speak for the whole profession. The Representative Body was the only body which could speak for the whole profession, and it must at all times and in all circumstances retain that ultimate right.

Dr. C. **Shiers** (Council) pointed out that the greater power of the autonomous bodies in the Association might become a danger to the overall authority of the Representative Body. He believed that unity would come only by lack of sectionalism and could not be tripartite.

Dr. A. V. **Russell** (Council) emphasized that the most important single thing in the B.M.A. was that the Representative Body should be the sovereign body and the sole policy-making body in the Association. That it was to be written into the constitution that the Representative Body would be able merely to receive the reports of the two autonomous bodies and not to discuss them was appalling.

Will or Must?

Dr. D. C. **Roberts** (Hendon) asked if the speakers were interpreting the meaning of the word "will" in the motion in different ways. Did it mean "may at their will" or "must"? Dr. **Wallace**, in reply, said "will discuss" meant "will discuss." He was opposed to the detailed discussion of the trivia concerning general practice, but when it came to the principle of a report presented to the Representative Body, it had to be in a position to discuss that report before it was "rubber-stamped."

Dr. H. **Glyn Jones** (Bromley), on a point of order, said it was not what Dr. Wallace thought the words meant which was important, but what the words meant. "Will" gave power for something to happen. If it were mandatory it would have to be "shall." Since it was not "shall" or "must," it gave power to the Representative Body without necessarily compelling it.

Dr. **Ronald Gibson** (Chairman of Council) said advice had been taken from counsel and solicitors on the matter of the power of the Representative Body. It was clearly stated in the Constitution Report that the Representative Body was the sovereign ruling body of the Association, and in all circumstances it should have the last word on anything involving the honour and interests of the profession and on matters medico-scientific. There was no need for concern about the matter. He said he would regret, if through passing the motion in a mandatory sense, the Representative Body should have to go through every item of every report. What was intended was that the Representative Body should and must have the opportunity to be able to consider in detail every item concerning every member and group of the profession and have the final word.

Dr. J. S. **Noble** said the motion was one with which he was in complete agreement, provided it was made clear what the Meeting was being asked to decide on. It had been the wish of the profession that the work of the Representative Body should be reduced and that it should have a proper relationship with the standing committees. On the other hand, the Meeting should support the sovereignty of the Representative Body. It was stated "the Representative Body will normally receive the reports of the committees, but, if it wishes, it has the right to disagree. . . ." The report also stated "that the Representative Body can decide on any matter at any time that it wishes."

Provided the Guildford motion meant it was not mandatory on the Representative Body to consider everything, then the Organization Committee was wholeheartedly in agreement, but if the intent of Guildford was that it should be mandatory then he had to oppose the motion.

Dr. **Wallace**, in reply, said the Meeting was at one on the matter. He was satisfied that the motion should be passed. It meant the Representative Body would preserve its right to speak on matters concerning all branches of the profession.

The motion was carried.

Question on Statement to Press

Dr. E. **Townsend** (Cornwall) asked if it was a fact that the statement made by Mr. Langston about the Junior Hospital Doctors' Association had already been released to the press.

The **Chairman** said that it had. He had already stated that the whole question of the statement by the Chairman of the Central Committee for Hospital Services (Mr. Langston) and what action had been taken might be discussed on the Annual Report of Council on hospital and consultant services.

Constitution (Resumed)

Representative Body and Autonomous Bodies

Dr. I. M. **Jones** (Sunderland) moved: "That paragraph 28 of the Report on the Constitution of the B.M.A. (Doc. A.R.M. 8) be amended by the addition of the following words: 'provided such reference back is passed by at least a two-thirds majority of the Representative Body.'"

(Paragraph 28 read as follows: "We therefore propose that the Representative Body should normally receive and approve reports on the work of the autonomous bodies, but when it wishes to exercise its right to disagree in any respect it would normally refer the matter back to the autonomous body before reaching a final decision.")

Dr. Jones said it was important that the Representative Body should have the right to review any issue which had previously been determined by the autonomous committees. But it was not right to waste the time of the Representative Body unless there was an opinion contrary to that of a sectional interest. The need to get a two-thirds majority would ensure that there would be no unnecessary debates in Representative Body, yet its absolute sovereignty would be retained.

Dr. **Noble** said that it was entirely for the Representative Body to decide what sort of majority it would wish for the reference back of any motion. But he would ask one question: Supposing a motion was referred back by a simple majority of the Representative Body, what would be the attitude of the standing committee to that motion?

Dr. **Jones**, in reply, said he thought the sensible thing would be for the chairman of a standing committee to refer the matter as a proper reference to his committee. That was the procedure that had been adopted for many years. He did not think that invalidated the point that Dr. Noble had made.

The motion was carried.

Regional Councils

Dr. C. O. **Lister** (Aldershot and Farnham): moved: "That Regional Councils should be composed of B.M.A. members only."

He said that the Association must surely have learnt that unity was its strength. Anything that it had got from the Government in the last few years had been obtained by unified pressure. Yet in the new constitution it was proposed that one of the major debating chambers, the regional council, should operate with non-members. The fact that representatives were gathered together as members of the British Medical Association was a token that they had a common purpose in meeting and in joining the Association. If there were august persons who would like to sit on regional councils they should join the Association. Otherwise they were not like-minded and the B.M.A. could do without their counsels.

Dr. K. A. WOOD (Portsmouth) said he opposed the motion. He did not exclude the possibility of restricting membership of regional councils to the B.M.A. members only, but the new constitution must be got off the ground. It was the duty of the Association to ensure that regional councils were fully functioning and recognized throughout the regional area as a body that was unifying opinion.

Dr. W. D. GRAY (Liverpool) said it would be possible for all those appointed to regional councils from outside bodies to be non-members of the Association. Liverpool thought that was wrong.

Asserting that the B.M.A. did far too much for those who were not members, thereby devaluing the privilege of membership, Dr. J. H. MARKS (Barnet) said the Association's first duty was to protect and advance the interests of its members. If others benefited indirectly that was their good fortune. Non-members were already represented in negotiations, and it was unnecessary to make more arrangements for them at regional level.

Dr. W. H. N. ANGUS (Southampton) said if regional councils were to do the job they were meant to do—to collate opinion in the regions and to send informed opinion to the centre—they must, unfortunately, allow non-members to be on them.

Replying to the debate, Dr. LISTER said: " Let us take some measure of pride in our membership. It is difficult enough these days to give answers to the non-member who asks, 'What do I gain from joining the B.M.A. that I do not already have ? ' "

The motion was carried.

Divisional Secretaries

Dr. J. A. RIGBY (Worcester and Bromsgrove) moved: " That divisional secretaries should have a seat on the proposed regional council."

Dr. Rigby thought the divisional secretary was a person who might well benefit from being a member of the regional council, and the regional council might also benefit. It was of value for the secretary to discuss things with other secretaries and other people in such places as regional councils.

Dr. G. CORMACK (Newcastle upon Tyne) asked what, in view of the previous motion, the Chairman of the Organization Committee would propose as the make-up of a regional council, as in some areas it would be extremely difficult to make it up from members of the Association.

Dr. NOBLE replied that, looking at the specimen constitution of the regional council, he thought it could be managed. There might be areas where there would be difficulty. Replying to the debate, Dr. Noble said that in his view there was not a case for extending what was a fairly large regional council by adding divisional secretaries.

Dr. RIGBY, in reply, disagreed with Dr. Noble. According to the specimen constitution a Division would have to elect its secretary as its representative on the regional council.

The motion was lost.

Dr. D. S. STRACHAN (Cleveland and Middlesbrough) moved: " That this Representative Body reaffirms its decision of 1966 to establish a regional council in a few selected areas for an experimental period, and that no reorganization be implemented, contingent on and in anticipation of the success of such an experiment."

Dr. Strachan said that his Division wondered whether the regional hospital board area was the ideal one for the regional council. While accepting the need for experiment, it was anxious to ensure that no reorganization in other areas took place on the assumption that the present experiment was a success. That was prejudging the issue.

Dr. NOBLE accepted the motion, and it was carried.

Dr. R. L. LUFFINGHAM (East Yorkshire) moved: " That, with reference to paragraph 16 of the Annual Report of Council, no regional council shall be set up unless and until a majority of the Divisions it would serve call for this."

Dr. Luffingham said that the substance of the motion was the policy of the Council but had not appeared in its Annual Report. The aim of the motion was to secure the Representative Body's ratification of the Council's decision. It was ridiculous to have a regional council if the Divisions did not want it.

Mr. G. E. MOLONEY (Council), supporting the motion, said that the regional councils were likely to be highly expensive. A great deal of the local B.M.A. work was done for nothing by medical workers. There had been a suggestion that the full-time medical secretaries would help in the recruiting drive, but that was not the correct way to obtain new members. New members were obtained in the old way. " By your works ye shall be known," suggested Mr. Moloney.

Dr. RONALD GIBSON (Chairman of Council) emphasized the difference between a regional council and a regional office, one of which was administrative and the other organizational.

Dr. LUFFINGHAM, in reply, pointed out that the financial report received by the Council had made it plain that a regional office would be financially viable only if the medical secretary was also secretary of the regional council.

The motion was carried.

Representative Body

The following motion in the name of East Yorkshire, " That the proposed new By-law 30 (*a*) be amended by the deletion of the words 'in Great Britain and Northern Ireland,' " was, by leave, withdrawn.

Size of Representative Body

Dr. R. L. LUFFINGHAM (East Yorkshire) moved: " That, with reference to paragraph 208 of the Annual Report of Council, the Chairman of Council, or his nominee, be asked to explain to this Meeting why the figures contained in paragraph 51 of the Report on the Constitution (*B.M.J.*, 26 November 1966) relative to the size of the new Representative Body are so inaccurate."

Dr. Luffingham observed that Dr. Noble in his opening statement had said that the figures had been " guessed." It was criminal to make a change in the size of the Representative Body based on estimated figures.

Dr. NOBLE said that the figures he had quoted were based on an estimate over many previous years of the Representative Body. If they were underestimated, he took full responsibility and humbly apologized to the Meeting. By reason of all the variations he had himself already given the figures could not be more than an estimate, and it could not be known until next year how many of the future members of the Council and how many chairmen of standing committees would be elected representatives.

Dr. LUFFINGHAM said that the Chairman of the Organization Committee had now accepted that the figure was wrong. An estimate that was out on such an important issue must invalidate the conclusions upon which the figures were based. Was there to be a smaller Representative Body or not ? He submitted the answer was in the negative.

The motion was carried.

Dr. A. M. MAIDEN took the chair.

Dr. E. TOWNSEND (Cornwall) moved: " That under the new constitution of the Association the size of the Representative Body should not be greater than 400."

He said that so long ago as 1952 in Dublin there had been a motion that the Representative Body be reduced in size, which had not been accepted. There were three kinds of representative: the man who was knowledgeable, interested, and capable of putting a case ; the man who was willing and moderately competent ; and the man who was impressed to complete the quota. Good debates were important and good debates depended to a great extent on good representatives. They could well do without those who were impressed to complete the quota.

The argument against reducing the size of the Representative Body was that attending it had an educational value. The educational value would be greater if the turnover of members who attended the meetings was increased. The majority of members who had made maiden speeches in the last few days had made a valuable contribution.

Dr. G. N. MARSH (Stockton) said that under the existing constitution a large Representative Body was needed. Without regional councils the only place a Division could express its opinions was through its own representative. Many of those views could now be aired at regional council level. A smaller Representative Body, composed of enthusiastic and informed members who had had to compete for their place, would be a more effective and efficient mouthpiece of the Association. He supported the motion.

Dr. R. P. HENDRY (Rugby) said the Meeting should be aware of the implications of the motion. It proposed an overall strength of 400. That would allow for only 280 divisional representatives. Very few of the constituencies would have two representatives, so that they could not arrange proportional representation. He was against the motion.

Educational Value

Mr. H. H. LANGSTON (Council) said that Dr. Townsend was wrong in saying that the purpose of having a large Representative Body was merely educational. With proportional representation under the new constitution, the Representative Body would fulfil a useful function in providing a check on what committees did. Only a body of reasonable size could produce informed opinion from the periphery to provide that check. He therefore hoped that the arbitrary figure of 400 would not be accepted.

Dr. TOWNSEND, in reply, pointed out that he had said that an argument against reducing the Representative Body that was often produced was that it was of educational value. He had then said it would be of much more educational value if it consisted of representatives who were interested. It could only be a check if it consisted of informed members. He was asking for fewer but more informed and interested members. He emphasized that the motion was linked with other motions asking for a considerable reduction in Council, and this would affect the whole picture.

The motion was lost.

Hospital Junior Doctors

On the morning of Saturday, 8 July, the Annual Representative Meeting at Bristol suspended its standing orders to enable Mr. H. H. LANGSTON to make the following statement.

Statement by Mr. Langston

"At the request of the Junior Hospital Doctors' Association, representatives of the British Medical Association met representatives of the J.H.D.A. on 29 June in order to hear the views of the J.H.D.A. about representative machinery for hospital junior doctors. A frank exchange of views took place, and the B.M.A. representatives undertook to examine the suggestions of the J.H.D.A. and to meet again in due course. On 30 June and on 6 July the Chairman of the J.H.D.A. wrote to the B.M.A. and expressed anxiety to continue the talks as soon as possible. In his second letter, the Chairman of the J.H.D.A. wrote:

"'Both sides realize that they must go back to their respective committees for a mandate to examine the problem jointly in more detail. We hope this will be done as a matter of urgency because, as we have stated in the press, unity within the profession is important in the long run. . . .

"'I would like to apologize in advance for the tone, but not the content, of some tendentious criticism in the second issue of *On-Call* about recent negotiations between the B.M.A.'s negotiating group of nine and the Ministry. I hope you will accept that because discussions may continue between our two associations, my executive would have toned down the presentation of this criticism had the newspaper not already been in press.'

"Notwithstanding these statements, a representative of the J.H.D.A. yesterday distributed copies, within this building in which the B.M.A. Representative Meeting is being held, of the second issue of the J.H.D.A. newspaper *On-Call*. This issue, like the first, contains statements and insinuations about the B.M.A., and about individual B.M.A. leaders, which go far beyond the bounds of what is acceptable or tolerable in public discussion and debate. In this atmosphere, we have regretfully come to the conclusion that no useful purpose would be served by continuing discussions with the J.H.D.A. and the Chairman of the J.H.D.A. has been so informed."

The Representative Body debated this statement, and a report of the debate will be printed next week. At its conclusion the Meeting resolved as follows:

"This Representative Body deprecates the continued attack on the B.M.A. leaders by the J.H.D.A., and offers its sympathy and support to all concerned. Nevertheless, this Meeting is of the opinion that talks should continue between the British Medical Association and the Junior Hospital Doctors' Association, provided that the Chairman of the Junior Hospital Doctors' Association disavows the actions of whoever distributed their publication."

The motion was carried by 224 votes to 61.

Unqualified Apology

During the afternoon the CHAIRMAN reported to the Representative Body that the Junior Hospital Doctors' Association had issued the following statement to the press:

"Today, after an emergency meeting of the officers of the Junior Hospital Doctors' Association Executive, Dr. Briggs, the Chairman, undertook to send to Dr. Gibson, Chairman of the B.M.A. Council, an unqualified apology for the distribution of copies of the second issue of *On-Call* at the B.M.A.'s Annual Representative Meeting at Bristol.

"He said that the J.H.D.A. Executive was in duty bound to send copies of the newspaper to its 4,200 members, but that its distribution at the B.M.A.'s A.R.M. was unfortunate and provocative, in view of the present discussions being held between the two Associations.

"He expressed the hope that meetings would continue between the two Associations in a friendly and open-minded atmosphere, and that the upset provoked by the criticisms in the second issue of *On-Call* would not obscure the major issue to be decided at present.

"Dr. Briggs said: 'It remains in the interests of the B.M.A. and the J.H.D.A. to continue negotiations on the matter of hospital junior doctor representation within one organization. Unity must come.'"

Dr. RONALD GIBSON announced that he had authorized the issue to the press of the following statement:

"The B.M.A. welcomes the spirit with which the J.H.D.A. has responded so quickly to the resolutions adopted by the R.B. this morning. The way is now clear for discussions to be resumed."

Representatives' Dinner

The Representatives' Dinner was held at Bristol on 6 July. Presiding over a company of some 500 representatives and their ladies at the Grand Hotel, Dr. A. N. MATHIAS, Chairman of the Representative Body, paid tribute to Dr. S. NOY SCOTT on his retirement from the Representative Body after 35 years continuously as a representative and as senior member of the A.R.M. Agenda Committee.

Dinner was followed by dancing until 1 a.m.

Hospitality

A German doctor living in Freiburg im Breisgau wants a girl of not less than 18 years old to stay *au pair* with his family from September for 6 to 12 months.

A French doctor living in Bayonne would like his daughter aged 22 years to stay *au pair* with a British medical family in or near London for three to four months from September or October.

A French doctor's son aged 17, living in Tiercé (Maine-et-Loire), would like to stay with a British medical family in August. In exchange the family would be pleased to receive a British boy of similar age in July or September.

An Italian doctor living in Rome would like his 14-year-old son to stay with a British medical family for four weeks in July or August. In exchange the doctor would be pleased to receive a British boy of similar age for four weeks at a convenient time.

An Austrian doctor living in Graz would be pleased to receive immediately a British doctor's daughter, aged about 14 years, to stay with her family for one month. In exchange the doctor would like her own daughter, aged 14, to stay with the British girl's family next summer.

Would anyone who is interested please get in touch with Dr. R. A. Pallister, Medical Director, International Medical Advisory Bureau, B.M.A. House, Tavistock Square, London W.C.1.

Central Consultants and Specialists Committee

The Central Consultants and Specialists Committee met on 29 June, with Mr. H. H. Langston in the chair. A report of the first part of the meeting, in which the Committee discussed its composition and that of the Joint Consultants Committee, was printed last week (Supplement, *8 July, p. 21*). *A report of the remainder of the proceedings is printed below.*

Distinction Awards

The Committee considered a letter from Mr. N. G. C. HENDRY about the distribution of distinction awards. The subject had been discussed with depressing frequency, he wrote. It had been taken to the Review Body, who indicated that it was a matter for the Distinction Awards Committee. The Distinction Awards Committee had indicated that it was a matter for the Review Body. In these circumstances it seemed reasonable to Mr. Hendry to bring facts to light as they became available, and he sent the following most recent figures from the Scottish Home and Health Department, showing the position of Scottish regional hospital board consultants relative to those with honorary contracts:

Category of Award	R.H.B.	Honorary	Total
A+	3 (11)	10 (2)	13
A	16 (34)	24 (6)	40
B	88 (108)	37 (17)	125
C	204 (215)	47 (36)	251
Total ..	311 (368)	118 (61)	429

The numbers in brackets indicated what the figures would be if distribution was proportional to the actual number of consultants in the two categories.

The Committee thought that this was an important matter and that it should be discussed at its next meeting, for which a memorandum could be prepared.

Ten-session Week

Dr. W. ESMOND REES spoke of a letter from the Welsh Regional Consultants and Specialists Committee expressing concern that abolition of the difference between part-time and whole-time service did not seem to have been considered by the C.C. and S. Committee. At a time when the Council of the B.M.A. was expressing its determination to expand private practice it seemed rather odd (the letter continued) that no steps were being taken to ensure the survival of private consultant practice. At many small centres it was not economically feasible for a young consultant to opt for maximum part-time practice, because the amount of private practice did not make up for the difference between part- and whole-time salary. The community in those areas was denied facilities for private consultation.

The Welsh Committee was convinced, the letter stated, that whole-time practice should be abolished in favour of a sessional contract and that preferably this should be on a "10/10ths basis." The essential point was that those who did the maximum number of sessions should not be precluded from private practice. The Welsh Committee saw no reason why this arrangement should not apply to all doctors in the hospital service except for those in preregistration posts.

Dr. Rees said there might be arguments about the 10/10ths method, but it seemed to the Welsh Committee that a whole-time doctor was employed 24 hours a day seven days a week, and he had no spare time. When the contracts were drawn up no allowance had been made for emergency work in calculating the matter of sessions.

The CHAIRMAN commented, on the last point, that emergency work should be taken into account. But if that was not the case, and no allowance had been made for emergency work in a substantial number of cases in Wales, the matter would be taken up.

Dr. T. D. CULBERT supported the proposals of the Welsh Committee. He hoped the matter would not be shelved. If adopted in their entirety the proposals would remove many of the anomalies in the employment of senior medical staff. Equally important, it would apply to the hospital junior staff, and he hoped that their representatives would speak on it. The sooner the change came the better it would be for the hospital service and for the medical staff.

No Strong Support

The CHAIRMAN explained that a scheme for dividing the whole-time week into 10 sessions, or half-days, had been circulated to regional committees in 1966, and there had been no strong support for a change. Mr. H. G. HANLEY believed that doctors did not understand the proposal. He hoped the Committee would discuss it and give a lead.

Mr. R. D. ROWLANDS was in favour of a 10-session week, but he could not support the scheme when the number of hours per week envisaged in the calculation was 40. Consultants were paid on an hourly not a sessional basis. If they now worked, say, 20 hours, that was divided by 3½. If the basis was a 40-hour week the payment would be reduced. He realized that that was compensated for in the draft scheme because there would be a rise in salary scale, but he did not think the Review Body would agree to any increase in salary scale, so in the long run consultants would lose. His regional committee supported the 10-session week and it thought the long-term aim should be a 35-hour week but in the short term it would be best to accept a 7½-hour day and 37½-hour week.

When the CHAIRMAN suggested that another document should be prepared and sent to regional committees, Dr. R. MAYON-WHITE said that it would probably prove fruitless. Many regional committees were not in favour of a change, and he was disappointed that they did not support the proposal more enthusiastically.

The Committee agreed that a document should be prepared and sent to the new Negotiating Committee.

Dr. I. G. JONES asked whether it was a matter for the Review Body or one that could be discussed in negotiations with the Ministry? The CHAIRMAN replied that he thought it was a matter which would go to the Review Body for pricing.

Inspection of Residential Accommodation

It was reported that, in response to resolutions of the A.R.M., 1965, regional committees had been asked whether they would arrange something like an annual inspection of residential accommodation in each of the hospitals in their region, with a view to reporting any in which the conditions were so bad that vacancies in them should not be advertised. Most of the committees had not been in favour of an annual inspection, but all had been prepared to look into any complaint from a member of the hospital junior staff.

The CHAIRMAN said that it was to everybody's advantage to know which accommodation was satisfactory and which was unsatisfactory accommodation. He hoped that regional committees would be prepared to undertake inspections.

Dr. CULBERT pointed out that in a region like Manchester it would be a full-time job. Dr. D. GUTTMANN was in favour of the matter being referred back to regional committees, and he asked that some guidance should be given on the sort of things that should be looked for in an inspection. There was a difference between listening to complaints from junior staff and actually inspecting.

Mr. H. A. KIDD said that an inspection of accommodation would not help the person occupying it. An approach should be made to the Ministry to discuss the matter. If the accommodation was substandard the charge for it should be substandard. That was the best way to bring influence to bear.

Hospital Medical Staffs Defence Trust

The Committee, meeting as the trustees of the Hospital Medical Staffs Defence Trust, received a report that, on a recommendation of the C.C. and S. Committee (Scotland), £600 had been donated from the Scottish Defence Trust funds to the Hospital Medical Staffs Defence Trust in respect of the year 1966.

Mr. L. DOUGAL CALLANDER, in presenting the Financial Statement, noted that the income had been slightly smaller last year. At the end of each year a good many bankers' orders were stopped owing to consultants retiring. Expenditure had exceeded income in the year 1966, and that was because of considerable expenses for the conference.

Report of Executive Subcommittee

The Committee considered a supplementary report from its Executive Subcommittee on constitutional matters affecting the Committee and associated bodies.

The Committee adopted certain recommendations of the Executive Subcommittee on the membership, administration, and standing orders of the Hospital Medical Staffs Conference.

Dealing with the Subcommittee's report on the Hospital Junior Staffs Group, the CHAIRMAN said that it had been thought to be important that the revised constitution of the H.J.S. Group (which the Committee had already approved in principle) should be before the Council for approval at its last meeting (*Supplement,* 8 July, p. 15). The Council had approved it.

The revised constitution of the H.J.S. Group was formally approved by the Committee.

The Committee also approved the following recommendations put forward by the S.H.M.O. Group's Executive Committee for the reform of the Group's constitution.

(1) That one S.H.M.O. Group Committee should replace the existing Group Council and Executive Committee.

(2) That the new committee should consist of 18 members, one from each region in England and Wales, two from Scotland, and one from Northern Ireland.

(3) That the Committee should normally meet before each regular meeting of the Central Consultants and Specialists Committee, but the chairman should cancel the meeting if there is insufficient business.

The Committee also approved the addition of a fourth item concerning the co-option of not more than two members, at the suggestion of Dr. E. GREY-TURNER, Deputy Secretary, speaking on behalf of the S.H.M.O. Group.

The Committee noted that the Executive Subcommittee had considered the revised report on the constitution of the B.M.A. (*Supplement,* 26 November 1966, p. 204), and that a motion had been included in the Agenda for the A.R.M. which, if carried, would ensure that both senior and junior hospital staff could be elected as representatives to the Representative Body.

Dr. E. A. HARVEY-SMITH thought that provision for the election of one representative from the H.J.S. Group from each region should be written into the constitution. Dr. H. GLYN JONES disagreed on the ground that it would make the constitution tremendously complex.

After a short discussion the Committee agreed to support the motion in the terms set out.

Work of Joint Consultants Committee

The CHAIRMAN reported on the work of the Joint Consultants Committee, the negotiating group, and of Whitley Committee B.

Dr. HARVEY-SMITH said that it seemed that the Ministry of Health was anxious to get away from any mention of the review of hospital medical staffing that came after the Platt report. It would, he thought, be foolhardy for the profession to allow the Platt review to be lost sight of. It was the only objective study that had been made.

Despite the excellent evidence given to the Review Body about the extra duty allowance, that had been turned down. It was said that work load had been taken fully into account in the last award.

The CHAIRMAN said that there was every intention of pursuing that matter so far as possible. He did not think it was true to say that the Ministry had thrown out the Platt review. It had recently admitted that there had been a failure to reach the median of the staffing requirements set out in the review. This was a matter which must be hammered at continually. Mr. Langston said his own feeling was that, particularly in some branches of medicine, not enough senior registrar posts were being created to enable the consultant vacancies to be filled. The tendency seemed to be to maintain the senior registrar establishment at a level required for the existing number of consultant posts and not to take into account sufficiently the requirements stated in the Platt report.

Mr. J. R. BLACKBURNE asked whether the instructions to hospital authorities contained in Ministry of Health circulars were mandatory.

The CHAIRMAN replied that hospital boards were asked to implement them straight away if they could. They were mandatory in the sense that where they could be implemented they had to be, and if they could not be the board had to explain why.

The Committee agreed to support a proposal that the new title for the medical assistant grade should be the "Assistant Grade," and that individual doctors should be known as "assistant surgeon," "assistant physician," etc.

At this point Mr. LANGSTON had to leave on urgent business, and Mr. W. S. LEWIN took the chair.

Interim Negotiating Subcommittee

The Committee received a report that the interim Negotiating Subcommittee had held its first meeting on 13 June, when the main items discussed were Categories I and II of the "Terms and Conditions of Service of Hospital Medical and Dental Staff." The Subcommittee, at a subsequent meeting with Ministry officials, had pressed strongly the view, which was set out in paragraph 50 of "An Appraisal of the Hospital Service" (*Supplement,* 17 July 1965, p. 70), that any services not directly concerned with the prevention, diagnosis, and treatment of illness should be regarded as outside the scope of the N.H.S. and transferred to Category II. A small working party of representatives of the Subcommittee and the Ministry were to meet to work out the details of any changes.

Medical Assistant Grade

The Committee considered a resolution from the S.H.M.O. Group Executive Committee stating its view that in the event of any future pay award to medical assistants the existing differential between the salary scales of the S.H.M.O. grade and the medical assistant grade should be maintained.

Dr. N. STRANG urged the Committee to support the resolution. He said there was no doubt that, with the close relationship between the salary scales of the medical assistant grade and the S.H.M.O. grade, S.H.M.O.s were becoming more and more associated with the medical assistant grade, despite previous assurances. There was a differential of only £125 at the top of the two scales.

The CHAIRMAN commented that the medical assistant grade was still in its formative years and it was likely changes would occur in the grade. Existing S.H.M.O.s had been given an undertaking that they could retain their name and seniority, and he did not think any Review Body would alter that. Dr. GREY-TURNER pointed out that the S.H.M.O. group wished to preserve the differential between S.H.M.O.s and medical assistants. The CHAIRMAN said that undoubtedly the committee would wish to support the resolution. But he had been rather nervous of talking about a differential in relation to a new group whose present salary scale might alter.

The Committee agreed to support the resolution.

New Consultant Posts

The Committee considered a report on new consultant posts. It pointed out that one of the major topics under discussion in the current "charter" negotiations was the profession's representations that immediate steps should be taken to attain the consultant establishment recommended as a result of the Platt reviews, and that there were many senior registrars, including some who had not yet completed the normal tenure of their posts, and also long-service registrars, who had the necessary experience to fill consultant vacancies immediately.

The profession had stated that there was a considerable number of well-trained registrars who had been held up in the grade by the bottleneck higher up. Discussions were taking place on the problems of time-expired senior registrars and of senior registrars who had only spent a short time in their present grade but had had long experience in the registrar grade.

The report stated that, as a first step towards alleviating this problem, hospital boards in England and Wales would, over the next few months, advertise additional consultant posts or readvertise unfilled consultant posts. Doctors with satisfactory training would not be excluded from consideration on the grounds that they had spent little or no time as senior registrars. Medical assistants would also be eligible to apply. There was no intention of lowering the standard of entry to the consultant grade, even temporarily, but it would allow every candidate to be judged by the advisory appointments committee on the length and quality of his training and experience, and on his other attributes, without being debarred by any rigid requirement about length of service in one particular grade. All the consultant vacancies that would be advertised were in posts requested in the Platt reviews.

The CHAIRMAN said that the negotiating group (the "Group of Nine") had been responsible for this interesting development.

Dr. GREY-TURNER emphasized that this was an important experiment.

Security of Tenure

The Committee considered a resolution referred to it by the Council from the Sutton Coldfield Division to the effect that the B.M.A. should press the Minister on the question of increased security of tenure for general-practitioner clinical assistants.

Dr. GREY-TURNER said that the proposal put to the Ministry had been that these doctors should be on a two-year contract in the first instance, and then renewable at seven-yearly intervals.

Mr. ROWLANDS thought that the doctors who warranted permanent tenure of office were those who had reached the medical assistant grade. Some of the clinical assistants were doing a short-term job for educational purposes. A number were earning high locum fees by filling casualty appointments and that type of post, which did not warrant permanent tenure of office.

Dr. H. L. LEAMING thought the Committee should be clear what was meant by a clinical assistant. He believed it was either a general practitioner who did two to three hospital sessions a week or a doctor who liked to help in hospitals and took the place of a house-officer on a part-time basis. In neither instance was security of tenure of more than six months necessary.

The CHAIRMAN said that general practitioners who wanted permanent posts would be likely in future to get part-time medical assistant posts.

Dr. A. N. MATHIAS (Chairman of the Representative Body) said that there were certain hospital jobs that had been graded for the last 18 years as clinical assistant posts.

Dr. BLACKBURNE said that if general practitioners gave up some of their practice commitments they wanted a more permanent contract. On the other hand, there were general practitioners who resented the fact that these posts were apparently held for any length of time by one doctor, and who wished them to be readvertised at frequent intervals. It was not always possible to make general practitioners medical assistants, since they might not have had the necessary training.

Mr. P. C. STEPTOE proposed, and Dr. J. W. WEDGWOOD seconded, a motion that the resolution should not be supported, and Dr. A. SKENE thought it would be wiser to note it. Dr. LEAMING said that the resolution could not be supported in its present form without further information.

The CHAIRMAN asked the Committee whether it would agree to a motion that, without further information, the Committee could not support a blanket increase in security of tenure for all general-practitioner clinical assistants.

The motion was carried.

Multiple Radiological Examinations

The C.C. and S. Committee decided to support the following resolution of the Radiologists Group Committee, and to refer it to the Negotiating Subcommittee:

> That the Central Consultants and Specialists Committee be informed that the Radiologists Group Committee considers that under the National Health Service (Pay-bed Accommodation in Hospitals, etc.) Regulations, 1953, the total of the charges levied by hospital authorities to Section 5 outpatients for multiple radiological examinations undertaken at the same visit are excessive. Multiple examinations undertaken at the same visit are by their very nature lower in cost to the hospital authority than if each examination were undertaken separately. The Radiologists Group Committee requests that the Ministry of Health be approached with a view to agreeing a formula for the compounding of charges for such multiple radiological examinations.

H.M. Forces

Major-General P. R. Wheatley, D.S.O., late R.A.M.C., has been appointed Honorary Surgeon to the Queen, in succession to Major-General R. A. Stephen, C.B., C.B.E., retired.

Appointments.—Wing Commander D. G. Jones (ear, nose, and throat duties, R.A.F. Hospital, Ely); Wing Commander J. D. Crowlesmith (senior medical officer, R.A.F. Wittering); Wing Commander H. D. Jones (anaesthetic duties, R.A.F. Hospital, Wegberg, Germany); Wing Commander J. P. McRory (deputy principal medical officer, Headquarters, Near East Air Force); Wing Commander L. K. Garstin (senior medical officer, R.A.F. Changi, Singapore).

ROYAL NAVY

ROYAL NAVAL RESERVE

Surgeon Lieutenant-Commander M. G. D. Davys, V.R.D., has been placed on the Retired List.

Surgeon Lieutenant H. G. K. Douglas to be Surgeon Lieutenant-Commander.

ARMY

Brigadier R. M. Johnstone, M.B.E., M.C., late R.A.M.C., to be Major-General.

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel J. B. J. Mulvey has retired on retired pay.

Major E. R. Briant to be Lieutenant-Colonel.

Majors R. J. Givans and J. Monro have resigned their commissions.

TERRITORIAL AND ARMY VOLUNTEER RESERVE

ROYAL ARMY MEDICAL CORPS

Brigadier Sir John Bruce, Kt., C.B.E., T.D., has been appointed Honorary Colonel 205 (Scottish) General Hospital, R.A.M.C. (Volunteers) T. and A.V.R., in a new appointment.

Major G. Hall-Davies, Reserve of Officers, to be Major.

22 Fri.	Planning Unit, 4.30 p.m.

Branch and Division Meetings to be Held

Members proposing to attend meetings marked ● are asked to notify in advance the honorary secretary concerned.

EASTBOURNE DIVISION.—At Beachy Head Hotel, Tuesday, 18 July, 7 p.m., dinner; 8 p.m., general meeting to receive report of representative to Annual Representative Meeting.●

KETTERING DIVISION.—At Hunting Lodge, Cottingham, Friday, 21 July, 8.15 p.m., buffet supper and cocktail party. Guests are invited.●

NORFOLK BRANCH.—At City Hall, Norwich, Thursday, 20 July, 4 p.m., annual general meeting followed by tea and tour of the City Hall. Ladies are invited.●

NOTTINGHAM DIVISION.—At 64 St. James's Street, Nottingham, Tuesday, 18 July, 8.30 p.m., ordinary meeting.

ROCHDALE DIVISION.—At Crimble Hotel, Monday, 17 July, 8.45 p.m., annual general meeting.

EAST ANGLIAN REGIONAL CONSULTANTS AND SPECIALISTS COMMITTEE.—At Bell Hotel, Thetford, Monday, 17 July, 8.30 p.m., meeting.

CONSULTANTS AND SPECIALISTS COMMITTEE: BIRMINGHAM REGION.—At Queen Elizabeth Hospital, Tuesday, 18 July, 5.15 p.m., meeting.

Meetings of Branches and Divisions

MORPETH AND BLYTH DIVISIONS.—Films presented by the Medical Insurance Agency were shown to members of the Morpeth and Blyth Divisions at a combined meeting on 28 June at Stannington, Northumberland. The programme consisted of travel documentaries on the Rhine and on Australia, and an informative film on insurance.

Branch and Division Officers Elected

PORTSMOUTH DIVISION.—Chairman, Dr. P. D. James. Vice-chairman, Mr. C. M. M. Murray. Honorary Secretary, Dr. J. A. Clark. Assistant Honorary Secretary and Treasurer, Dr. C. L. C. Arnold.

PRESTON DIVISION.—Chairman, Mr. R. S. Garden. Chairman-elect and Vice-chairman, Dr. J. G. Lord. Joint Honorary Secretaries and Treasurers, Dr. D. T. Irwin, Dr. W. M. Thomas.

READING DIVISION.—Chairman, Mr. C. Grimshaw. Vice-chairman, Dr. G. E. Mitchelmore. Honorary Secretary and Treasurer, Dr. T. J. Nokes. Assistant Honorary Secretary, Dr. O. Caiger Smith.

REIGATE DIVISION.—Chairman, Dr. T. H. Bingham. Chairman-elect and Vice-chairman, Dr. L. S. P. Divers. Honorary Secretary and Treasurer, Dr. K. R. Hughes. Assistant Honorary Secretary, Dr. R. G. Hornung.

ST. LUCIA BRANCH.—President, Dr. R. E. M. Lees. Honorary Secretary and Treasurer, Dr. B. K. Sil.

SUTTON COLDFIELD, LICHFIELD, AND TAMWORTH DIVISION.—Chairman, Mr. F. R. Hurford. Chairman-elect, Dr. A. R. Elsom. Vice-chairman, Dr. G. Hoyle. Honorary Secretary, Dr. E. C. Raybould. Honorary Treasurer, Dr. A. Parkes.

WAKEFIELD, PONTEFRACT, AND CASTLEFORD DIVISION.—Chairman, Dr. A. Reeves. Vice-chairman, Dr. J. McRobert. Honorary Secretary, Dr. H. Watson. Honorary Treasurer, Dr. L. J. Burns.

Correction

In the report of the meeting of the General Medical Services Committee (*Supplement*, 8 July) Dr. C. J. Wells was wrongly reported (p. 20) as speaking on the subject of information to hospitals.

British Medical Association

Annual Representative Meeting

The Annual Representative Meeting of the Association met at Bristol on 6, 7, 8, and 10 July, under the Chairmanship of Dr. A. N. Mathias. A report of the first part of the proceedings was printed last week. Printed below is an account of the remainder of the Meeting.

Third Day: Saturday, 8 July (Continued)

Junior Hospital Doctors' Association

Dr. H. GLYN JONES (Bromley) moved the suspension of Standing Orders.

He reminded members that earlier Mr. H. H. Langston had made a statement about negotiations with the Junior Hospital Doctors' Association (15 July, *Supplement*, p. 65). That statement had gone to the press. Unless anything arising out of it was discussed now, and urgently, what was said by the Representative Body on the matter would not reach the evening papers and would not reach the daily press until Monday.

There were those who deplored the statement. (Applause.) It had referred to "we"—"We have regretfully come to the conclusion that no useful purpose would be served by continuing discussions with the J.H.D.A. and the Chairman of the J.H.D.A. has been so informed." The statement did not even make clear who "we" meant, said Dr. Glyn Jones. He doubted whether "we" necessarily meant the Representative Body of the Association.

The motion to suspend Standing Orders was carried.

Dr. A. N. MATHIAS resumed the chair.

Dr. A. K. THOULD (Cornwall) regretted having to make his maiden speech to the Representative Body in disagreement with Mr. Langston, but he felt, as did the rest of the representatives of his constituency, that the matter was of considerable importance. They strongly disagreed with Mr. Langston's statement.

Dr. Thould said he spoke as a young consultant of some two years' standing. He was therefore well aware of the problems and frustrations of junior medical staff in hospitals. He thought that they had a case. The B.M.A. had not in the past been as thoughtful and considerate of their problems as it should have been. He thought that the Association was now reaping the rewards of past neglect, because the anger and frustration of these young people had boiled over and they were, in the manner of young people, a little more outspoken than they should be. Their rudeness was unforgivable and should not be allowed to continue, but he thought that for a senior body to break off negotiations with a young embryo group, who were angry because they were frustrated, was a mistake. (Applause.)

He asked Mr. Langston seriously to reconsider his statement. In particular, Dr. Thould said he thought it was unfortunate that it had been released to the press before the Representative Body, which was in session, had an opportunity to discuss it. (Applause.)

Debate on Statement

Dr. B. D. MORGAN WILLIAMS (South Warwickshire) proposed the following motion: "That this Meeting is of opinion that talks should continue between the British Medical Association and the Junior Hospital Doctors' Association."

Dr. R. L. LUFFINGHAM asked what majority would be required to pass the motion, and the CHAIRMAN ruled that a simple majority would be needed.

Dr. MORGAN WILLIAMS said that the statement issued to the press was a hasty, not very sensible reaction to a somewhat over-exuberant youthful organization. It was a shocking move, and he believed the Meeting should cancel it.

Dr. H. GLYN JONES (Bromley) said it was essential that the B.M.A. should continue these negotiations. A large body of junior doctors believed, rightly or wrongly, that the B.M.A. did not represent them. Great criticism had been made of what was in *On-Call*. Certainly there were points that were a little unfortunate; nevertheless there was nothing that was defamatory. There were rhetorical questions asking whether the negotiators could be trusted on behalf of the junior staff. That kind of comment was legitimate in a newspaper. There were references to amateur negotiators, but the question whether the profession should have professional negotiators had arisen before. It was quite true that the word "amateur" had not been used in a polite way, and there were rather snide remarks about "unelected representatives" who, in fact, were elected representatives but perhaps not elected by a very representative body of people. These were not very wise remarks to be made at a time when the Junior Hospital Doctors' Association was hoping for discussions with the B.M.A., but they were no more than that. There was nothing in the article to which the Association or the people referred to could take umbrage. He hoped the negotiations would continue.

Dr. D. HOOKER (Cornwall) said it was unfortunate that the B.M.A. should have taken such an undemocratic, sharp, sudden action. The youth in the medical profession had for a long time thought that Auntie B.M.A. moved slowly and was not very interested in them. It had been true, but nowadays in Divisions a really sterling effort was being made to contact the young members. He believed that the B.M.A. had begun to win the young men, but the action taken earlier that morning could spoil all that work.

Manner of Doing

Mr. M. J. GILKES (Brighton and Mid-Sussex) said he wanted the discussions with the junior doctors to continue. It would have been perfectly possible to have presented the motion with overtones of censure, but he did not wish to do that. Nevertheless it must be underlined that it was not what was done but the way in which it was done which was vitally important.

Remarking "that these young men were not bad chaps," Dr. A. ELLIOTT (Redbridge) said surely the B.M.A. was adult enough not to take offence about some silly remarks in a schoolboy sort of paper. Dr. G. S. R. LITTLE (Council) said he was quite sure that these young doctors did not want to perpetuate the mistakes that had been made. They had their professional life in front of them, and the Meeting should take into account the circumstances of their anger.

Speaking as Vice-Chairman of the B.M.A.'s Hospital Junior Staffs Group, Dr. J. R. Bennett (Council) said the Meeting must get some sense of proportion. Instead of taking another opportunity to have a go at the C.C. and S. Committee, the junior doctors should remember what the position was. The Hospital Junior Staffs Group contained many doctors who had laboured and battled for years within the democratic machinery of the B.M.A., with the backing of the Chairman of Council, the Organization Committee, and the C.C. and S. Committee. They had achieved a position in which they were able to play their part in the Association and in the negotiations on behalf of their colleagues. They were doing that now with the authorities.

"This has been achieved not because of splinter groups but despite them, and despite constant, unremitting attacks of an unpleasant kind which have continued for a space of nearly two years now," asserted Dr. Bennett. He went on to say there was an enormous amount of sympathy for this group of what some imagined were innocent young men. The fact was the B.M.A. had known about the Junior Hospital Doctors' Association for nearly a year, though most representatives had had very little contact with them, and few had even seen the edition of *On-Call* which had been distributed the day before. That distribution yesterday was "too much."

Chief Officers

The Chairman said he had received a communication asking Mr. Langston to interpret the word "we" in the statement.

Mr. H. H. Langston said the chief officers felt they had had to take urgent action about the document, and the "we" referred to the Chairman of Council, the Chairman of the Hospital Junior Staffs Group Council Executive Committee, and himself.

Dr. E. A. Harvey-Smith (Chairman of the Hospital Junior Staffs Group) said the last thing he wanted was to break relations with any hospital junior staff, but "one could not negotiate or discuss when, every time one left the room, another publication was made in which all one's work was thrown back into one's face." He wanted to see a strong Hospital Junior Staffs Group within the B.M.A. That was the only place for it. The Hospital Junior Staffs Group of the B.M.A. had increased its force in negotiation over the past three or four years. What the Junior Hospital Doctors' Association was asking was that junior staff should have an autonomous standing committee of the B.M.A. This might be an excellent idea, but if so it should be discussed and put forward to the Council and to the A.R.M. next year. There should not be fighting in the press. Negotiations should continue, but not in the prevailing atmosphere.

Dr. Joan Chappell (Council) said she admired the independence and energy of the Junior Hospital Doctors' Association, but those who had read the leaflet would agree that some of its publications had been over-enthusiastic and not professional. A junior member of the Council had been named in the last publication, and she thought an apology should be a preamble to renewed negotiations. It was difficult to negotiate and go forward to solve serious problems in an atmosphere of damaging and vituperative comments.

Dr. M. R. Sheridan (North Middlesex) moved an amendment: "That this Meeting asks for a retraction of the statement made by the Chairman of the C.C. and S. Committee, and that negotiations with the Junior Hospital Doctors' Association must be allowed to continue."

He said the Junior Hospital Doctors' Association had not the finesse or aplomb of the B.M.A., with whom it was negotiating. Mr. Langston and others had got together to produce a statement, forgetting that the Representative Body was the parliament of the Association.

Flimsy Excuse

Dr. A. Elliott (Redbridge) supported the amendment. He said the three chairmen had decided to make a statement and break off negotiations because of a publication. He thought it was a disastrous state of affairs for the young doctors of the country if such a flimsy excuse was used to break off negotiations.

Dr. Ronald Gibson said he had spent a major part of his career in the Association being concerned with the affairs of younger doctors. The B.M.A.'s Hospital Junior Staffs Group and Dr. Harvey-Smith worked extremely hard and had done very well. It was necessary only to consider the changes there had been in the constitution, and the fact that the B.M.A. was now negotiating on behalf of the young doctors with the Minister. The whole debate had centred on the fact that the Meeting should support a splinter group and not the B.M.A.'s own group. His thesis from the beginning had been that the B.M.A. should support its own group.

What had been done had not been a hasty decision. The B.M.A. had not taken any action on the first edition of *On-Call* because it wanted to do everything it could to help. The Junior Hospital Doctors' Association had asked for a meeting, and that had been agreed to. The B.M.A. had gone to great lengths to help. It had had discussions, and he had received a letter from Dr. Briggs, Chairman of the J.H.D.A., the day before saying that he had been happy with what had taken place. The B.M.A. had never abused the J.H.D.A. But facts might as well be faced: those innocent simple people had had everything beautifully timed for the Representative Body. The B.M.A. would go on talking provided the Junior Hospital Doctors' Association would act like gentlemen, as the Association had behaved.

Speaking to the amendment, Mr. H. H. Langston said that if it was suggested that he and his colleagues who had produced the press statement should be prepared to go on, without any retraction or any form of apology from the J.H.D.A., he could say unequivocally that the three of them would not be so prepared. "We are not closing the door to further discussions," he said. "But so long as this document is in existence, without any apology or any statement, we cannot go on."

Dr. G. R. Smith (Birmingham) said that the Chairman of Council and Mr. Langston were guilty of symptomatic treatment of the worst type. He added: "To make an issue over this document is to ignore the disease that has produced the document." He had looked at the document and had found nothing offensive in it to anyone of any stature. If the B.M.A. negotiators could not take criticism they should not be negotiating. The fact remained that had it not been for the young doctors forming their own association the British Medical Association would not have moved with the speed that it had moved in producing a hospital doctors' "Charter."

Greatest Asset

Dr. D. R. Cook (Camden) said he greatly regretted that the statement had been issued. "Here we were, doctors of all kinds in greatest peril, our greatest asset being unity, and we have issued a statement suddenly and arbitrarily which was bound to alienate the good will of a section of our youngest doctors." There was a tradition in this country of robust political argument.

What was the authority of the statements that had been made? Were they made with the authority of the J.H.D.A.'s negotiators? Might it not be that the Meeting would have to save those negotiating for the young hospital doctors from their friends? "Do not let us issue a statement which means the end of the road," he concluded.

Dr. M. R. Sheridan, in reply, said that everyone could understand the reasons that had produced the statement. It was still not good enough. Dr. Smith had mentioned membership. The B.M.A. could not afford just to drop off the Junior Hospital Doctors' Association and say, "We have regretfully come to the conclusion that no useful purpose would be served by continuing discussions. . . ."

The amendment was lost.

Dr. R. L. Luffingham (Council) moved as a rider: "provided that the Chairman of the J.H.D.A. disavows the actions of whoever distributed their publication."

This was the whole nub of the problem. On the one hand Dr. Briggs's letter contained an apology for what was going to be published, and then a representative of the J.H.D.A. had yesterday distributed copies of *On-Call* at the A.R.M. Nobody knew if that had been done with the knowledge and authority of its chairman. If it was, quite obviously it was in bad faith, because the chairman of the J.H.D.A. had written one thing and had authorized another. The question was how much the J.H.D.A. supported this scurrilous document.

Circulation Not Stopped

Dr. Ronald Gibson said that everyone knew that one could order a thing to be printed but stop its circulation. That could easily have been done.

Dr. G. R. Outwin (Council) agreed with all that Dr. Luffingham had said. It seemed to him that this been a carefully planned manœuvre to bring about the very explosion that had been produced. If so, the Meeting should support the rider.

Mr. Langston thought the rider made a substantial difference to the motion and might well make it acceptable. Dr. J. S. Happel (Council) hoped the Meeting would not pass the rider but vote on the motion. Whether to approve the statement or turn it down was a matter for debate. If the Meeting started to tell some person outside the hall what he must do it was making a mistake. A general opinion should be expressed and the action left to the individual concerned.

Dr. H. Glyn Jones (Bromley) said that the original motion was simple and did not condemn anyone. It expressed an opinion to the Representative Body that the negotiations should continue. He pleaded with representatives to be content with that. If the rider was added it would bring into the issue the pride of other people. He did not think the attack was such as to be intolerable to people who were of reasonable stature in their own profession. He asked representatives to leave the issue as a simple hope that negotiations would continue and that unity should be achieved.

Dr. A. K. Thould (Cornwall) supported the rider. The Meeting should not lose sight of the fact that justice must be done to Mr. Langston and to the Chairman of Council. (Applause.)

Dr. Luffingham (Council) echoed the words of Dr. Thould. The motion would repudiate the action properly taken by the Chairman of Council and his two senior colleagues. It had been the Chairman's duty to do that if he thought that it was in the Association's interests. If the motion was to be passed there must be the assurance that there was good faith on the other side.

The rider, "provided the Chairman of the J.H.D.A. disavows the actions of whoever distributed their publication," was carried.

Untrue Statement

Dr. D. Guttman (Council) said he did not wish to use the platform to reply to personal abuse. He wished merely to refute the statement that he had not been democratically elected to any of the positions in which he had served junior hospital staff. The statements were untrue and he could prove it at the proper time. Nevertheless, he would be in favour of continuing discussions with the J.H.D.A. if it disavowed the damaging statements, both particular and general, it had made about the B.M.A. and those members of the Association, both senior and junior, who had tried to serve hospital junior staff.

Dr. Arnold Brown (Public Health Committee) said that he felt most disturbed about the whole affair. Some of the young men in question could be, and he hoped would be, big men in the B.M.A. one day. They were bitter because they believed, wrongly, that the Association was not what they needed to gain improvement in their conditions of service. It was the business of the Association to raise the standard of the medical profession and the conditions of service in the various branches of the profession. Dr. Brown said he most sincerely hoped that the Meeting would decide that discussions should continue with the J.H.D.A.

Dr. L. P. Grime (Junior Members' Forum) said he supported Mr. Langston's statement. If various sections of the profession split off, as they were doing, its bargaining position was weakened.

Dr. W. A. H. Stevenson (St. Marylebone) said it was a question of mediation on the one hand and continued negotiation on the other. The B.M.A. should go on trying to negotiate, irrespective of whatever views were expressed by the J.H.D.A.'s leaders, but at the same time exacting from them due responsibility for their behaviour.

Extreme Provocation

Dr. G. E. Owen Williams (C.C. and S. Committee) said that the Meeting was facing the possibility of disunity not merely in the Association but in the profession. The need for unity was paramount. It was understandable that the Chairman of the C.C. and S. Committee, under extreme provocation, had spoken on behalf of the Meeting before the Meeting had decided upon the matter. It should be left at that. There were 3,000 avowed members of the Junior Hospital Doctors' Association. The Meeting risked splitting down the middle the main trunk in order to keep alive a twig at the other end. It was not inevitable that breaking off discussions made it impossible to resume them.

Mr. A. Lawrence Abel (St. Marylebone) moved an amendment to add the words: "and retract all scurrilous and offensive remarks." He said the word "disavowed" was not enough, and that all rude remarks should be retracted.

The amendment was lost.

Dr. A. W. Macara (Junior Members' Forum) suggested that the statement made by Mr. Langston did not compromise the Association in regard to further negotiations. Mr. Langston had stated that it was his view that in the prevailing atmosphere negotiations could not be continued. What had created the atmosphere were the scurrilous remarks which had been made. The standards by which the B.M.A. judged those with whom it should negotiate were those of decency, integrity, and accuracy. If the Meeting supported the motion it would be betraying those who had been working in the interests of hospital junior staff.

Dr. J. S. Happel (Council) moved an amendment to add the words, "That this Representative Body deprecates the continued attack on B.M.A. leaders by the Junior Hospital Doctors' Association and offers its sympathy and support to all concerned. Nevertheless," at the beginning of the motion.

He said the Representative Body should preface any resolution by an assurance of support, because passing the motion in its original form placed the chief officers in a difficult position.

The amendment was carried by 148 votes to 105.

Deliberately Circulated

Mr. Langston apologized to the Chairman and the Representative Body that the statement had inevitably occupied so much time. He thought it right that the statement had been debated so fully. The C.C. and S. Committee had been anxious to meet this organization, and in order not to prejudice the issue in advance, though the provocation had been strong, it had made no reply to the original issue of *On-Call* which had suggested such things as collusion between the C.C. and S. Committee and the Ministry. The meeting with this group on 29 June had been welcomed.

The issue of *On-Call* under debate must have been in preparation when it was known that the meeting on 29 June was to take place. It had been circulated—not only published but deliberately circulated—to the Association. It contained all sorts of tendentious remarks about some of the senior members, which they were prepared to take. What he was not prepared to take was the outright attack on the junior members who had been giving days and nights in the last six months to discussions at the Ministry—very often, he believed, to the jeopardy of their professional careers. It had been suggested in *On-Call* that the juniors had twisted things, that they had not represented things fairly and fully, that they had not been properly elected. "This makes it quite impossible," Mr. Langston said, "to go on

Lord Cohen of Birkenhead (left) being presented with the Gold Medal of the Association by Mr. R. V. Cooke, President, at the adjourned annual general meeting held at the University Great Hall. The citation and another picture of Lord Cohen appear at p. 99.

talking frankly and freely to these people until this sort of thing is retracted."

He had no desire to close the door to any group which had a real sense of grievance and which had a case it wanted to put up, but it must be quite clear to any such group that if discussions were to be fruitful there must be none of these tendentious smear attacks on the people who were trying to do the job for the junior members. The atmosphere of public attack made continued discussion impossible, but if there was a real, substantial withdrawal of all this, and a promise that it would not occur again while discussions went on something might be achieved.

Dr. Morgan Williams (South Warwickshire) said that Mr. Langston had reminded the Meeting that the second issue of *On-Call* had been prepared before the Central Consultants and Specialists Committee had met the Junior Hospital Doctors' Association. Something had been said about the J.H.D.A. being unable to stop or correct what appeared in *On-Call*. The Meeting was asking, in effect, that the Junior Hospital Doctors' Association should control its somewhat scurrilous publication.

The motion: "This Representative Body deprecates the continued attack on the British Medical Association leaders by the Junior Hospital Doctors' Association and offers its sympathy and support to all conconcerned. Nevertheless, this Meeting is of the opinion that talks should continue between the British Medical Association and the Junior Hospital Doctors' Association, provided that the Chairman of the Junior Hospital Doctors' Association disavows the actions of whoever distributed their publication."

The Chairman announced that the motion had been carried by 224 votes to 61.

The Representative Body returned to Standing Orders at 3 p.m.

Constitution (Debate Resumed)

Size of Representative Body

Dr. R. P. Hendry (Rugby) moved: "That the overall size of the Representative Body should be about 500 members."

He said that there were four essentials for a future Representative Body. They were: (1) proportional representation geographically and in the field of practice; (2) adequate representation of even minor groups; (3) increased representation of the hospital junior staff; and (4) that these things should be achieved without depriving any Division of its present rights of separate representation under By-law 40. Rugby believed all this could be achieved within a membership for the Representative Body of 538, and Dr. Hendry asked permission to alter the figure in the motion to 538.

Permission for the change was given.

Dr. J. S. Noble said that the Representative Body had already agreed that there was no virtue in an exact figure of 400, and he saw no great virtue in an exact figure of 538. The intention was to achieve a slightly smaller Representative Body. Bearing that in mind he suggested the rejection of the motion.

Dr. R. L. Luffingham (East Yorkshire) remarked that the whole business had gone wrong. There had been requests for the figures in the appendix to the Constitution Committee's report to be corrected, and Dr. Hendry, like others, had been deceived by them. The motion should be supported. A year ago the Council had been asked to come up with a scheme in which all the loose ends had been tied up, but rapidly it was becoming untied. He suspected the Council had not done its job.

Dr. Hendry said that the amended figure of 538 would give those supporting the Rugby proposals everything they wanted.

The motion was carried.

Dr. R. P. Hendry (Rugby) moved: "That the area of each regional hospital board shall be a constituency returning at least one representative, who shall be elected by the members employed as hospital junior staff (as defined in the proposed By-law 40(5)) by hospital authorities within each region."

He pointed out that even places as large as Manchester or Leeds would still be too puny to have a junior hospital staff representative in his own right. It was nonsense to regard a place as big as Manchester as being too small. He proposed that each regional hospital board should become a constituency.

Dr. Noble said that in view of the increased estimate in the size of the Representative Body it gave him the greatest pleasure to accept the resolution by Rugby, which would mean 21 more seats for the hospital junior staff. However, representatives must bear in mind that they must "watch how this goes." He was not convinced that the hospital junior staff would not themselves seize a number of seats in the Divisions.

Dr. E. A. Harvey-Smith (Hospital Junior Staffs Group) called for the Representative Body's support for the motion. Junior staff must attend the A.R.M. from the regions as of right. Their own Group was based on the regions. It was there they held their elections and it was from there they should come. Dr. J. R. B. Turner (Leeds) also supported the motion strongly.

The motion was carried.

Mr. C. O. F. Rieger, of Australia, President-elect.

Proportional Representation

Dr. Noble formally moved: "That the change of policy contained in paragraph 59 of the revised Report on the Constitution of the B.M.A. be approved."

Dr. R. L. Luffingham (East Yorkshire) said it was difficult to know who wanted proportional representation. The previous year the Representative Meeting had rejected it. In 1964 at the Representative Meeting in Manchester Mr. Langston had said that if anyone was proposing proportional representation it would not be accepted by Council. Dr. Noble on the same occasion had said that he hoped the motion under discussion would be accepted in the broadest sense, but "if the resolution sought proportional representation he would oppose it." Why had a change come about in 2½ years? Dr. Luffingham suggested that no one wanted proportional representation. He submitted that the proposals now before the Meeting did not provide for proportional representation. It was not satisfactory, therefore, for the Chairman of the Organization Committee to ask the Representative Body to make a change in policy. If what was wanted was proportional representation let Dr. Noble come before the Meeting with a proposal, which he had not done.

Dr. W. P. Lambie (Sheffield) said that the Meeting was being asked to reverse the policy of 1966. From a reference back to the debate on the constitution the previous year it would be seen that the Meeting had not considered mandatory quota representation to be desirable. It was unnecessary, inflexible, and meant that constituencies would be deprived of sending to the A.R.M. those they wanted to represent them and would have to elect instead certain people in order to fill places in a quota.

Dr. K. A. Wood (Portsmouth) said that the proportional representation proposed in the report of the Constitution Committee was the minimum necessary to ensure that the prestige of the Representative Body was maintained. Each section of the profession must be able to see that the B.M.A. represented all doctors if it was to be confident in the Association's management of their affairs.

Recognized Way

Dr. J. M. W. Sedgwick (East Herts) opposed the motion. He pointed out that proportional representation was a well-recognized way, used in many countries, of making more certain that those persons whom the electors most wanted to elect were actually elected. It had been argued that the method proposed by the Council was the only way by which proportional representation could be attained. He did not believe that was so. It could be done by separate groups electing their members in the right proportion.

Dr. C. O. Lister (Aldershot and Farnham) emphasized that it was desirable above all to have doctors on the Representative Body who were keen, who wished to come, who were representatives of quality. It was no good doctors coming because they were the only people who fitted the bill under the quota system.

Dr. F. G. Tomlins (Waltham Forest) related that in his Division all members of the Division were asked to attend meetings.

Local officers had gone out of their way to get hospital junior doctors to attend, and had held a special meeting for them. Meetings were held at the main hospital in the Division. Yet the meetings were hardly ever attended by a hospital junior doctor and rarely by a consultant. Nevertheless, the Division in two successive years had elected a hospital doctor and a general practitioner to represent it. Last year the hospital doctor had been unable to attend the A.R.M. This year, he had again been unable to come and his place had had to be filled by a general practitioner. It was important that representatives should be appointed who really represented the Division.

Dr. D. Burrell (Winchester) advised representatives to think carefully before voting against the motion. They had to remember that they had already decided that each regional hospital board should be a constituency to elect a junior member. The Meeting had to look at the whole new constitution. If the motion was defeated the Organization Committee would have great difficulty in putting any of the new constitution into operation.

Dr. D. C. Roberts (Hendon) suported the motion. The last A.R.M. had supported proportional representation. The Organization Committee had had to work out a way of doing what the Representative Body asked. He fully supported what it had done.

Give Confidence

Supporting the proposal, Dr. C. C. Lutton (East and Mid-Lothian) said if the proposal was agreed it would be the kind of reform which would give confidence to those who were often opposed to the B.M.A. and would make it a real fighting organization.

Mr. J. R. Blackburne (C.C. and S. Committee) said a speaker had asked who wanted proportional representation. The answer was those who thought they were not properly represented. One of the chief problems of the constitution of the Representative Body was that some doctors thought it was not representative of all the interests of the profession, and that was one of the objects in reforming the constitution.

"We are asking you as a body made up of some 75% of general practitioners to give up some of your rights in order that there will be adequate representation of some minorities," said Mr. Blackburne. "Those of you who have the interests of the Association at heart will be prepared to surrender some of those interests in order to have better proportional representation, including representation of minor groups."

Dr. W. J. C. Scott (Dunbartonshire), asking for the wholehearted support of the Representative Body for the motion, said a vacuum would be created unless it could be filled by doctors other than general practitioners, and that was the whole idea of the proposals. With such a constitution the Association would thrive.

Dr. D. T. Davies (South-west Wales) said a constituency should be in a position to choose its representatives whether they were general practitioners, consultants, or members of other branches of the profession. It was open now to any member of the Association to become the representative of his constituency, and if some doctors did not show an interest in their Divisional meetings, and therefore were not elected as representatives, no changes in the constitution would help them.

Dr. Noble said it had been decided the previous year that no single section of the profession should be allowed to dominate all other sections in the Representative Body. There had been a reference by Dr. Davies to Divisional meetings. It was regrettable that a section of the profession did not find Divisional meetings a channel through which it sought to find its home in the B.M.A., but for all that such doctors were members. Last year the Representative Body had approved the principle of proportional representation, but what had been objected to was the mandatory nature of it. He did not think the Committee's suggestion prevented the Meeting from giving an earnest of its intent to be truly representative of the whole profession.

The motion was carried by the necessary two-thirds majority.

Remain Void

Dr. R. M. Warren (Southampton) moved: "That if the proportional representation allowed in the Division becomes impossible to fill the seat remains void."

It was an honour and a responsibility to be elected to represent a Division, but it might become more so in future, said Dr. Warren. The Division should be sufficiently active and keen to attract interest from all branches of the profession. If the motion was carried there would be an additional incentive to fill places allocated to a Division. If it were found impossible to recruit representatives the seat should remain void.

Dr. S. E. Josse (Camden) moved the amendment: "That the words 'the seat becomes free and any member of that Division may be elected to fill it' be substituted for the words 'the seat remains void.'"

His Division was not against proportional representation. What Camden was saying was that where a seat could not be filled it should be declared free and any member should be elected to fill it. Camden had several hundred members and 200 who were on the staff of teaching hospitals. Meetings were rarely attended by any hospital staff. If the hospital staff wished to be elected as representatives they could go to the meetings.

The amendment was agreed.

Dr. B. L. Alexander (Manchester) asked the proposers to define the words "impossible to fill."

Dr. Warren said they applied if there were three categories and there were only two representatives available. He added that by voting for the amendment the Meeting had apparently negatived the motion. He hoped the Divisions would try very hard before they decided that a place was "impossible to fill."

The motion, as amended, was carried.

Two-year Review

Dr. R. M. Warren (Southampton) moved: "That the proportional representation in the Representative Body be reviewed every two years."

Dr. Noble suggested that the motion should be amended to read "in two years' time" instead of "every two years," and Dr. Warren said that would be acceptable.

The motion, as amended, was carried.

Dr. M. McKendrick (Hexham) moved: "That this Meeting demands that Divisions continue to enjoy the right of separate representation in the Representative Body contained in By-law 40."

He said perhaps it was no surprise that the motion came from one of the smaller Divisions, as did so many of the motions seeking to modify the new constitution. "By this might be seen the enthusiasm of the smaller Division, particularly, for the Representative Body and endorsement of the value which we see in it," he said. He based his argument on two principles. Firstly, the need to retain the viability of the Division as the basic unit of Association structure, and, secondly, the need to maintain the position of the Representative Body itself as the parliament of the profession. It was no good saying that it was to be hoped that the Division would continue to be the basic unit of the Association if at the same time its right to direct representation in the Representative Body was taken away. That prin-

At the President's Reception held at the City Museum are, left to right, Mrs. Golding, Dr. H. M. Golding, chairman, Local Organizing Committee, the President, Mr. R. V. Cooke, and Dr. Beryl D. Corner, from the Children's Hospital, Bristol.

ciple was most jealously guarded by smaller Divisions, and he would commend it to the Representative Body.

Dr. Noble said he had great sympathy for the resolution. He believed the Hexham Division was one of those cases that should be dealt with by the Organization Committee as a case for special representation of its own, because it was geographically isolated.

However, if the motion was passed it would upset the Council's efforts towards true representation, because it would increase the number of single constituencies. Every Division should have the right to apply to Council for separate representation.

A motion that the question be now put was carried by the necessary majority.

Dr. McKendrick said, in reply, that Dr. Noble had used precisely the arguments he expected against the motion, and he strongly asserted that they were in no respect valid. "We see it as a right that the individual member in the Division should have his say in the Representative Body through his own representative," he said. "This, I think, is incontrovertible."

The motion was carried.

Elections to Council

The election of the following 10 members of Council by the Representative Body was announced: Mr. A. Lawrence Abel, Dr. Joan Chappell, Dr. G. E. Crawford, Dr. J. S. Happel, Dr. R. P. Hendry, Dr. J. L. McCallum, Dr. G. N. Marsh, Dr. H. B. Muir, Dr. J. S. Noble, and Dr. C. M. Scott.

Dr. Ronald Gibson said that representatives might not have noticed that Mr. L. Dougal Callander had not offered himself for re-election this year. Mr. Callander was one of the B.M.A.'s elder statesmen. All members knew the debt of gratitude they owed him for his work as Treasurer and for the Estates Committee. He was a Gold Medallist of the Association. "He may be elderly in years," said Dr. Gibson, "but I do not think he is elderly in mind or in heart. We shall miss him on the Council." Dr. Gibson said he was sure the Representative Body would join him in thanking Mr. Callander for all he had done for the B.M.A.

The Meeting accorded Mr. Callander a standing ovation.

Mr. Callander thanked the Meeting.

Constitution (Resumed Debate)

A motion standing in the name of Rugby, "That where geographical isolation renders joint meetings impracticable any U.K. Division shall have the right to apply for separate representation as a constituency," was carried.

Dr. R. P. Hendry (Rugby) moved: "That greater flexibility should be given to allow members working in different minority fields of practice to be eligible for election as Divisional representatives."

Dr. Hendry said the motion, if carried, would allow any Division which had several keen minority representatives to elect more than one minority group representative. For example, if a Division had good public health and a good research representation it would be able to elect two representatives, one from public health and one from research. It would not often happen, but it was wrong to say to a Division that it should not elect too many from minority groups.

Dr. Noble said that though there was a great deal in what Dr. Hendry had said, he hoped the Meeting would not carry the motion as a mandatory one.

The motion was carried as a reference to the Council.

The motion standing in the name of East Yorkshire, "That the proposed new By-law 40(1) be amended by the insertion of the words 'amended by the substitution of the figure 3 for 2 in line 53 of the First 'Schedule' after the words 'First Schedule' in Paragraph 1," was, by leave, withdrawn.

Mr. H. H. Langston (Chairman of the Central Consultants and Specialists Committee) moved:

"That with reference to paragraph 57 of the revised report on the constitution (Doc. A.R.M. 8), clauses (5) and (6) of the proposed By-law 40 (Appendix XIII, Doc. A.R.M. 2) be further amended, to read:

> (5) Of the representatives elected by any constituency having the right to elect five or six representatives not more than three shall belong to the same category and at least two shall be engaged in hospital practice and of these one shall be a consultant or senior hospital medical officer and the other shall be a senior registrar, registrar, medical assistant, senior house officer, or house officer.
>
> (6) Of the representatives elected by any constituency having the right to elect seven representatives not more than four shall belong to the same category and at least two shall be engaged in hospital practice and of these one shall be a consultant or senior hospital medical officer and the other shall be a senior registrar, registrar, medical assistant, senior house officer, or house officer."

Mr. Langston said the motion incorporated a correction of an omission in the by-law which he imagined the Organization Committee would be prepared to accept.

Dr. Noble accepted the motion, and it was carried.

A motion standing in the name of East Yorkshire, "That the proposed new By-law 40 section (7) be referred back on the grounds that in its present form it is too difficult to interpret," was, by leave, withdrawn.

By-law 44 (Doc. A.R.M. 2, Appendix XIII)

Dr. R. P. Hendry (Rugby) moved, "That Council shall have discretion to appoint up to five additional spokesmen for minority groups."

Dr. Hendry said 5% of doctors were shown as "unclassified" in the report of Council. The Council had the right under the present constitution to give five seats to small minorities and groups not otherwise properly or adequately represented. Five did not seem adequate and the Council should have more within its discretion. If it was not found necessary to use the seats they need not be filled.

Dr. Noble said the operative word was "discretion," and he accepted the motion.

The motion was carried.

Dr. R. L. Luffingham (East Yorkshire) formally moved: "That the proposed new By-law 44A be amended: (1) by the addition of the words 'and Council in announcing the appointment of the said five representatives shall state the reasons for making these'; and (2) by the addition of a further paragraph to be numbered (4) reading: '(4) Provided that no representative appointed under the provisions of this By-law shall take his seat until his appointment has been approved by a simple majority of representatives elected from the Divisional constituencies.'"

Dr. Noble asked whether the Meeting wished the representatives to appear at the "bar of the house" until they had been voted for by a simple majority of the representatives elected by Divisional constituencies. Was that the way the Representative Meeting wished to welcome the new representatives? He asked the Meeting to reject the second part of the motion.

Dr. Luffingham, in reply, said that he saw Dr. Noble's point. However, the proposal was meant for the armed Forces representatives who had not taken their seats until the opening stages of the meeting. The motion would ensure that the Council was careful as to the representatives it selected.

The motion was carried.

Constituencies for Electing Representatives

Dr. J. S. Noble formally moved:

"That the proposals published in Appendix II of the revised Report on the Constitution of the B.M.A. be amended as follows:

> "(i) That A.R.M. constituency No. 19 be divided into two, that is, East and Midlothian (one representative) and West Lothian (one representative).
>
> "(ii) That A.R.M. constituency No. 23 be divided into two—viz., Fermanagh (1 representative) and Tyrone (1 representative).
>
> "(iii) That A.R.M. constituency No. 28 be divided into two—viz. East Denbigh and Flint (1 representative) and West Denbigh and Flint (1 representative).
>
> "(iv) That A.R.M. constituency No. 31 be divided into two—viz., Swansea (2 representatives) and Mid-Glamorgan (1 representative).
>
> "(v) That A.R.M. constituency No. 63 be divided into two, viz., Mid-Cheshire (2 representatives) and Crewe (1 representative).
>
> "(vi) That A.R.M. constituencies No. 80 and 82 be reconstituted, viz., 80—Sutton Coldfield and Walsall (2 representatives) and 82—Coventry and Nuneaton (2 representatives)."

An amendment standing in the name of Tees-side was accepted as a reference, as follows: "That constituency No. 45 should consist of three Divisions—namely, Cleveland and Middlesbrough, Hartlepools, and Stockton—returning three representatives, and constituency No. 46 should consist of the Darlington Division alone, returning one representative."

Dr. F. O. Wells (East Suffolk) moved as an amendment: "That A.R.M. constituency No. 89 be divided into North-east Suffolk (one representative) and East Suffolk (two representatives)."

He explained that the proposed new constituency was 55 miles from north to south and 35 miles from east to west. It was similar in size and distribution to constituencies such as Cornwall. It covered nearly 2,000 square miles.

Dr. Noble pointed out that the motion and the amendments were covered by the

Hexham motion carried earlier, and the Meeting agreed that it was so.

Dr. R. P. HENDRY (Rugby) moved: "That every U.K. Division having not less than 50 members may continue to form a constituency, but that the basis for the allocation of seats be changed to be one representative for the first 150 members and one additional representative for each additional 200 members or part thereof."

He said that the Meeting had agreed what the target should be for the size of the Representative Body. This was a matter of getting to the target. As far as he was aware, the Chairman of the Committee was prepared to accept the motion as a reasonable way to reach the target.

Dr. NOBLE said that by passing the Hexham motion the Representative Body had made it imperative that the "road to Rugby" should be taken. His only fear was that as a result representatives would find it more difficult to achieve proportional representation, especially on a geographical basis, but that was probably now the nearest the Meeting would get to a reasonable proportional representation married to the sacrosanct right of representation of the Divisions.

Substantial Change

Dr. R. L. LUFFINGHAM (East Yorkshire) pointed out that this proposal was a substantial change. It should be considered carefully because it made nonsense of the proposed constituencies. As guidance or as a reference to the Council it was fair enough, but as it stood it committed the Association.

Dr. HENDRY, in reply, said that if the constitution was not changed in this way presumably the five existing constituencies would be left, which would result in a very much bigger Representative Body.

Dr. J. S. ROSS (Council) agreed with Dr. Luffingham. This proposal would alter the whole situation and would throw the question of the division of constituencies back into the melting-pot. The Organization Committee had examined all sorts of different ways of achieving the correct proportional representation and had, with the exception of Dr. Hendry, agreed that there was much to be said for as many Divisions as possible having their representative. But there had to be a limit in order to get proportional representation. Bearing in mind the other motions already passed, he hoped the Meeting would not accept the motion.

Dr. C. C. LUTTON (East and Mid-Lothian) stated that under this proposal if the membership altered the number of representatives would alter as well. There could not be two yardsticks. The yardstick had been set at 538 members. That could not now be changed.

Dr. NOBLE repeated that the "road to Rugby" was now the road to take in view of the previous decisions taken by the Representative Body.

The motion was lost.

The following motions by East Yorkshire were, by leave, withdrawn:

"That the proposed new By-law 45 be amended by the addition after 'Research Workers Committee' in Section (1) of the words, 'Provided that no representative be appointed under this By-law who is not certified by his Divisional Executive to be an active member of his Division and that any such representative shall be subject to the provisions of By-law 47C, Section (4).'"

"That the proposed new By-law 45, paragraph (4), be amended by the addition after 'respectively obtained' of the words 'Provided that no deputy representative be appointed under this By-law who is not certified by his Divisional executive as being an active member of his Division and that any such deputy representative shall be subject to the provisions of By-law 47C, Section (4).'"

The following motion by Aberdeen was also, by leave, withdrawn: "That the Scottish representatives on the Representative Body should be nominated by the Scottish Council."

Nomination and Election of Representatives

Dr. JOYCE E. BROOKS (Southampton) moved: "That a postal vote be the sole method of election to the Representative Body."

She said that some members were disgruntled, accused the B.M.A. of not being democratic, and claimed that its representatives were not democratically elected. Doctors who could not attend Divisional meetings seemed particularly prone to that view. Under the new constitution there must be good standing between Divisions and the regional councils. The postal voting system would ensure that the representatives were properly elected.

Dr. D. C. ROBERTS (Hendon), opposing the motion, said that for many years it had been B.M.A. policy to have two alternative ways of electing representatives from Divisions; by voting or by a decision at the meetings. Last year it had been proposed by the Council that there should be a postal voting system, but this had been rejected by the Representative Body. It had decided that the appropriate method could be chosen locally. In the past, so far as he knew, the postal vote had never been used.

Dr. S. WAND (Treasurer) said the proposals for an increased membership of the Representative Body were going to cost a lot of money. The suggestion in the motion would cost £2,000 a year. There was no reason why the postal vote should not be used where it was considered necessary, but to make it the only method was going too far.

Dr. M. GOODMAN (Liverpool) reminded the Representative Body of the existing method of electing the Council. It was by postal ballot, and the results of the returns in those elections did not compare favourably with the ordinary system of electing representatives at Divisional meetings.

The motion was lost.

A motion standing in the name of Rugby, "That the present By-law 42(3) be renumbered By-law 47D and given a separate heading 'Constituency Meetings,'" was accepted.

Representative Body and Council

Dr. DORIS M. ODLUM (Bournemouth) moved: "That this Meeting instructs Council that proportionate representation on Council itself shall be voluntary."

Her Division had preferred the voluntary principle. Whether it worked in the long run depended on good will. No amount of orders would produce good will. If the proportional representation was made mandatory and it did not work the B.M.A. would look foolish.

Mr. J. R. BLACKBURNE (C.C. and S. Committee) said his chairman was anxious the motion should be defeated, because there had been many occasions in the Council when he had been the only representative to speak for the hospital services.

Dr. B. L. ALEXANDER (Manchester) said that if the Representative Body was to be proportionately represented on a mandatory system the same rule should apply to the Council. Dr. R. L. LUFFINGHAM (East Yorkshire) said that in his own experience the Council had never had fewer than a certain number of consultants as members.

Dr. NOBLE wanted further clarification, on a point of order. The Organization Committee had worked during the year on the assumption that proportional representation for the Council had been accepted by the Representative Body in 1966 by the necessary majority.

The CHAIRMAN said that was not so. Minute 45 of the 1966 Meeting had made it clear that that part of the motion had been defeated.

Dr. NOBLE hoped that, since the Representative Body had accepted proportional representation for itself, it would demand the same for the Council.

The motion was lost.

The motion standing in the name of Southampton, "That continuous steps be taken by Council to reduce the size of the Representative Body and of Council" was accepted.

Ex-officio and Co-opted Members of Council

Dr. T. O. LEWIS (Swansea) moved: "That under the proposed new constitution of the Association the Chairman of the Welsh Committee, as a member of the Council, shall have full voting rights."

The proposed new constitution would reduce the Welsh voting representation on the Council from three to two. Doctors in Wales were prepared to accept it, despite the difficulties that existed between North and South Wales, but the Chairman of the Welsh Committee should be given the courtesy of voting rights.

Dr. D. L. WILLIAMS (East Denbigh and Flint) said doctors in North Wales were represented in the Council by two voting representatives. Statistics and rules were fine, but it was "a dry and cold constitution" that allowed a Chairman of a Committee representing all Wales to attend the Council but refused him the vote.

Dr. D. L. W. CHAPMAN (Council) suggested that the Chairman of the Welsh Committee and of the other two regional standing committees should be treated differently from other chairmen.

Dr. NOBLE said the Organization Committee had devised a Council in accordance with instructions, and had thought the Council would benefit by having the guidance and advice of the chairmen of all the standing committees, but it had been thought proper that chairmen of standing committees should not vote. If the motion was carried it would open the floodgates.

Dr. T. O. Lewis (Swansea) said the Organization Committee had to accept the responsibility for the recommendation of reduction in voting and the effect it would have on the encouragement of new members.

The motion was lost.

Chairman of Journal Committee

Dr. Mary Esslemont (City of Aberdeen) moved: "That the Chairman of the Journal Committee should be *ex officio* a member of the Council of the British Medical Association."

The only Committee Chairmen suggested as *ex officio* members of the new Council were all persons concerned chiefly with medico-political matters. The income of the publishing department in the past year had been well over £1m. The image of British medicine abroad was in no small way determined by the quality of the *B.M.J.* and its associated special journals. It was a great responsibility for the Chairman of the Journal Committee. He should be in a position to be fully in touch with medical opinion in the country and, for that reason, be a full member of the Council.

Dr. Noble said that he opposed the motion. Chairmen of Committees could attend every Council meeting; the only bar was voting rights.

Dr. J. L. McCallum (Council) said it was no good saying the Chairman of the Journal Committee could attend on occasions when the *B.M.J.* was being discussed. How was he to know when to attend?

Dr. Esslemont, in reply, said that if it were possible for the Chairman of the Journal Committee to be present at every meeting it was equally possible to give him the importance of a vote, especially when points of policy came up in relation to the *Journal*.

The motion was lost.

Elected Members of Council

Dr. A. M. Maiden took the chair.

Dr. Noble moved: "That the provision for the election of one woman member of Council by the women members of the Association be retained, and that the appropriate addition be made to Appendix IV of the revised report on the constitution of the B.M.A."

Dr. E. Virginia Saunders-Jacobs (Woolwich) said women doctors had equal training and competition in their work. If they were to be appointed to the Council they would be appointed to represent their Division or their section of medicine. There were administrative problems which were different for women, and the Council should have the advice of someone who was there, watching the interests of women members.

Dr. Jean E. Lawrie (Dartford) said it was well understood that women doctors in the United Kingdom had career problems related to their family commitments. It would be a blow to many women members if their representative's place on the Council were lost.

Dr. Sanchia FitzMaurice (Westminster and Holborn) said that in 10 to 15 years' time 15% of the total medical manpower would be returning from motherhood to work. "Those of us who are fortunate and lucky enough to have emerged to the glorious freedom of middle age can look after their interests. We are the biggest trade union on the face of the earth. We will take care of our own interests as women, and the only respect in which we crave your indulgence as women is in this one special matter of helping medical women to get back to work."

The motion was carried.

An amendment by Mid-Glamorgan, "That the Council of the B.M.A. should always include a woman member of the B.M.A.," was approved.

Direct Vote

The following motion from East and Mid-Lothian was formally submitted: "That under the new constitution all the members of the Council to be elected by local constituencies of members in the United Kingdom should be elected by direct vote of individual members and by no other method."

Dr. W. W. Fulton (Glasgow) moved as an amendment to insert after "United Kingdom" the words "with the exception of Scotland."

He said there were a number of matters affecting Scotland on the agenda. The amendment would enable the Representative Body to consider those items and to take decisions at the right time.

Dr. E. R. C. Walker (City of Edinburgh) said there were occasions when Glasgow and Edinburgh saw eye to eye, and this was one of them. The report of the Constitution Committee stated that modification of the system of election to the Council would be required to provide for the filling of the five Scottish seats on the Council. It had been recommended that both matters should be referred to the Scottish Council and that it should be asked to submit recommendations. That had been done. Those recommendations had not been referred to in the Annual Report of the Council. It merely listed four different possibilities, and went on to state that it favoured a system which had not so far been considered by members in Scotland. What was proposed was that the whole of Scotland should be one single constituency. Edinburgh and Glasgow thought that the Representative Body should know what the Scottish Council had recommended and why it had done so, and so be given a chance to judge whether the Council had been right in rejecting the recommendations. That was the purpose of the amendment.

Dr. D. Buchanan (Council) said that the members in Scotland were far from unanimous on the issue under discussion. What had been carried the previous year was already the policy of the Representative Body—that 40 members of the Council should be elected by postal vote by members in the United Kingdom. "So far as I know, Scotland is still part of the United Kingdom," said Dr. Buchanan.

Dr. C. C. Lutton (East and Mid-Lothian) also denied that there was the overwhelming support for the amendment that had been alleged. Approximately half the Divisions were against it.

Negation of Free Speech

Dr. J. Riddell (Chairman of the Scottish Council) said that the principle contained in the motion was in many ways excellent, but everyone was anxious to preserve free speech. It was on that score that he was forced to oppose the motion. When the Scottish Council considered the new constitution it had put a proposal to the Organization Committee which that Committee had felt unable to consider in view of the terms of its remit. The Committee had said that the Scottish proposal would have to be put to the Representative Body. That was about to be done in two motions by Glasgow and Edinburgh. Dr. Riddell said he understood that if the motion under discussion was carried the motions by Glasgow and Edinburgh would fall. That would be the negation of free speech. Any representative who wished to support the principle of the individual voting directly could support the amendments to the next motion on the agenda.

Dr. C. J. Swanson (Council) also pointed out that if the Meeting passed the motion as it stood the Glasgow and Edinburgh motions would automatically fall. Dr. J. G. M. Hamilton (Edinburgh) supported the amendment merely in order to be able to speak to later motions. Dr. W. J. C. Scott (Dunbartonshire) said there was a cleavage right down the middle of Scotland and the Representative Body was being asked to act as an independent arbiter. After a lot of discussion it had been agreed at the A.R.M. in 1966 that every member should have a vote in the election of his member of Council. "If it is good enough for the rest of the United Kingdom, why not for Scotland?" asked Dr. Scott.

Dr. J. S. Ross (Council) said that he realized that there were special difficulties for Scotland, but in the case under discussion he could see no reason for special pleading. Why should Scotland depart from the general principle that members of Council should be elected by the periphery?

Dr. H. B. Muir (Council) asked whether Dr. Scott and Dr. Lutton had been speaking to the amendment or to other motions which might arise later. The Chairman replied that, since the amendment was a rather narrow one, the speakers had been permitted to show why Scotland should have a special procedure. Dr. J. E. Miller asked whether it would not be reasonable to give others who had contrary arguments to those adduced a chance to put them to the Meeting.

Dr. Noble reminded the Meeting that it had been a firm decision of the Representative Body that the elections of the regional members of Council should be by individual members. It was the existing policy.

Dr. Fulton, in reply, said he had deliberately not entered into the merits or demerits of the case as had most other speakers. The issue was complicated. Later the Meeting would be asked to decide certain matters for Scotland. Unless the amendment was accepted the Meeting would be denied that opportunity.

The amendment was lost.

Further Amendment

Dr. G. R. Outwin (Council) moved as an amendment: "That under the new constitution, members of Council shall continue to be elected by previous constituencies by direct vote of individual members and no other method."

He said he considered that the Representative Body was going too far too fast. A complex three-tier structure was to be built on foundations whose ability to support it was unpredictable. It was much better to preserve the present election of the Council from the periphery by the existing constituencies until the Association had had a chance of trying out the regional councils.

Dr. NOBLE pointed out that the Representative Body had approved proportional representation in respect of the Council in 1966 and had confirmed it at this Meeting. A schedule of constituencies had been prepared for the election of the Council, which provided a fair degree of proportional representation. With proportional representation and a return to the old constituencies it was difficult to know just what would happen.

Dr. OUTWIN, in reply, said he thought it would be wise to wait at least two years, until the regional councils had had a chance to prove themselves, before taking this drastic step.

The amendment was lost.

The motion, "That under the new constitution all the members of Council to be elected by local constituencies of members in the United Kingdom should be elected by direct vote of individual members and by no other method," was carried.

Chairman's Decision Challenged

Dr. H. B. MUIR and Dr. J. E. MILLER challenged the action of the Chairman (Dr. A. M. Maiden) in putting the East and Mid-Lothian motion to the Meeting so soon. Dr. Miller said there were three speakers on the platform wishing to speak to the motion, which was an extremely important one for Scotland.

The CHAIRMAN said that he had made an error. He said he would re-open the debate on the East and Mid-Lothian motion. It read: "That under the new constitution all the members of Council to be elected by local constituencies of members in the United Kingdom should be elected by direct vote of individual members and by no other method."

Standing Orders were suspended, and debate was resumed on the above motion.

Dr. C. C. LUTTON (East and Mid-Lothian) said that the direct vote of members must never be disenfranchised. Last year there was an overwhelming vote to this effect, and if this system was changed under the new constitution it would be possible to end up with four or five different ways of electing members to the Council.

Dr. JOAN K. SUTHERLAND (City of Edinburgh) said it had been stated that it was essential that members should all be elected in the same way. This statement needed careful thought, as totally different conditions existed in many parts of the country. As the population was distributed in Scotland, it would be almost impossible for smaller Divisions ever to get a member elected to Council.

Dr. J. E. MILLER (Council) said that the situation in Scotland, where there were vast areas covered by small Divisions, must be carefully analysed. There were "two big battalions" concentrated on Edinburgh and Glasgow, and it was possible that all five members elected to Council would come from these areas if elections to Council were by direct vote, taking Scotland as one constituency. Justice must be done to the smaller Divisions. He wished all areas in Scotland to have adequate representation, which could not be effected in that way. He asked the Meeting to reject the motion.

Dr. A. J. MACLEOD (Outer Islands) asked the Meeting not to disturb the status quo. Scotland wished to preserve the appointment of peripheral members in the rural areas. He asked the Meeting to support the motion.

Dr. NOBLE said that the East and Mid-Lothian motion was merely a reaffirmation of existing policy, and as it concerned the whole of the United Kingdom he advised the Meeting to pass it.

Dr. LUTTON, in reply, said that if the motion were lost the new constitution and everything it stood for would go back into the melting-pot. He asked them to support the motion as it stood.

The motion was carried.

Scottish Constituency

Dr. J. S. NOBLE then moved: "That the five members of Council elected by members in Scotland be returned from a single constituency embracing all these members of the Association."

Dr. R. T. CAMPBELL (Stirling) moved the following amendment: "That the five members of Council for Scotland should be elected by the five single-member constituencies as at present."

He said that the Stirling Branch had considered the matter fully and there was nothing to gain by taking Scotland as a single constituency. The geographical distribution would be in danger, as Glasgow and Edinburgh would out-vote the northern Divisions.

Dr. D. BUCHANAN (Council) said it was only in the past few years that satisfactory contact between the periphery and the centre had been achieved. The sacred cow—proportional representation—was now proposed, but that sacred cow could not survive in every area of the country. In the cold north geographical representation was more important in some cases than proportional representation.

Dr. W. J. C. SCOTT asked the Meeting to oppose the amendment, which would not ensure proportional representation, whereas if Scotland was regarded as one constituency it would ensure that one branch of the profession was not over-represented.

Dr. J. G. M. HAMILTON (City of Edinburgh) supported the amendment. He said that to treat Scotland as a single constituency was absolute nonsense. "You can do it in Belfast, Liverpool, and St. Marylebone, but you cannot do it in a country the size and shape of Scotland," he said. The political, geographical, and practical way was by the five single-member constituencies as at present.

Dr. W. W. FULTON (Glasgow) asked the Meeting to vote in favour of the amendment as "second best."

Dr. J. S. NOBLE said that he was sorry if some members of the Scottish Council thought that their advice had been spurned, but he could not support the amendment.

Dr. CAMPBELL, in reply, said he did not think Dr. Noble was correct. Proportional representation could be worked in by individual constituencies.

On a vote 91 voted for the amendment and 58 against.

Dr. A. N. MATHIAS resumed the chair.

Further Amendment

As a further amendment Dr. A. A. CLARK (Dunbartonshire) moved: "That this body proposes that if the five Scottish members in Council are elected by Scotland as a single constituency geographical representation should be maintained by there being not more than one member elected from each of the present five constituencies."

He submitted that this amendment was the only method of electing the Scottish members of Council and retaining proportional representation. The main point of the amendment was that geographical representation should be maintained. If the Organization Committee's proposal was accepted as it stood there would be a ridiculous position where the five members from Scotland elected to the Council in London could all be from one Division.

Dr. J. S. MCCRAE (Ayrshire (with Wigtownshire)) said that whatever method of election of the Council members was chosen it must, in accordance with the new constitution, be representative of the profession as a whole. That meant proportional representation, which had already been approved. Dr. McCrae said that so far as he was concerned there were three principles involved—namely, election by popular vote, regional representation, and proportional representation. He assessed them in that order of priority.

Dr. CLARK, in reply, asked the Representative Body if it realized the position if the motion from the Organization Committee was accepted. In fact, the City of Edinburgh and the City of Glasgow Division could elect all five members of the Council.

The amendment was carried.

The motion as amended was carried.

Dr. J. E. MILLER (Council) pointed out that a motion containing two incompatible amendments had been passed. It could not therefore be passed in that form.

Dr. W. W. FULTON (Glasgow), on a point of order, stated that if the amendment by Dunbartonshire was passed as an amendment to the amendment by Stirling it became the substantive motion. He hoped the Meeting would now pass it as the substantive motion.

The CHAIRMAN said he thought that the amendment by Dunbartonshire overruled the amendment by Stirling, and therefore the Organization Committee's motion could be passed as amended by Dunbartonshire's amendment as a substantive motion.

Dr. R. B. L. RIDGE (Council) pointed out that when the amendment by Stirling was declared carried by 91 to 58 votes it became the substantive motion, though this was not declared as the Chairman was taking advice about a two-thirds majority. Having become the substantive motion, the amendment by Dunbartonshire was then taken as an amendment to the new substantive motion.

The CHAIRMAN ruled that the amendment by Dunbartonshire was covered. He said that the Organization Committee's motion as amended by Stirling became the substantive motion. Stirling's amendment required a two-thirds majority. The vote on Stirling's amendment would be taken again. The vote on Stirling's amendment was taken again and carried by the necessary majority.

Advice on Procedure

The CHAIRMAN made a statement to the Meeting. He said that he had been advised by the Solicitor that if the Meeting had voted on a motion without appreciating the effect of the vote it was in order for him, as Chairman, to give the Meeting an opportunity of correcting what it had done.

The Meeting had passed the motion by Rugby "That the overall size of the Representative Body should be about 538 members." It had rejected the following two motions (as amended) by Rugby:

"That every U.K. Division having not less than 50 members may continue to form a constituency, but that the basis for the allocation of seats be changed to be one Representative for the first 175 members and one additional Representative for each additional 200 members or part thereof."

"That By-law 41 be *not* deleted but clause (2) be amended thus: delete the figure '150' and substitute '175'; delete words from '. . . for each complete . . .' to end of paragraph and add 'and one more for each complete number of 200 members in excess of one hundred and seventy-five members.'"

The effect was that the numerical right of representation of Divisions set out in the existing By-laws remained unchanged. In consequence, the Meeting's decision to add other members—for example, a motion by Rugby which added at least 21 junior hospital staff representatives—meant that the size of the Representative Body, it was now estimated, would be about 625. In view of the inconsistency of those decisions the Chairman said that the Meeting would have to consider whether it wished to reconsider the two motions by Rugby which had been rejected.

The Meeting adjourned at 6.15 p.m.

Fourth Day: Monday, 10 July

The Meeting resumed on Monday morning at 9 a.m., with Dr. A. N. MATHIAS in the chair.

The CHAIRMAN said he hoped representatives would bear in mind the need to avoid an adjourned meeting, primarily on the ground of expense. There were also constitutional difficulties.

The Agenda Committee recommended that at the end of the discussion on other motions from Divisions and Branches he would invite Dr. Noble, the Chairman of the Organization Committee, to make a statement on the present position of the constitutional proposals as a result of the decisions taken by the Meeting on Saturday. The Meeting had to finish by 5 p.m. If there had to be an adjournment he undertook that any motions withdrawn to facilitate business would be restored to the agenda for discussion at the adjourned meeting.

Motion of Thanks

Dr. D. P. STEVENSON (Secretary) moved a vote of thanks to all who had contributed to the success of the Bristol Meeting. Those concerned were:

The Lord Mayor and Corporation of Bristol; the Chancellor, Vice-Chancellor, and Court of the University of Bristol; the President, members, and staff of the University Union; the Dean and Chapter of Bristol Cathedral; the Chairman and Board of Governors of the United Bristol Hospitals; the Chairman and members of the South-western Regional Hospital Board; the Chairman of the Bristol Division and the President of the Bath, Bristol, and Somerset Branch, who had been the hosts for the Meeting; the Chairman and members of the Ladies Committee; the Chairman and members of the Hospital Management Committee of Southmead Hospital; all those who had kindly provided hospitality for the ladies.

Dr. Stevenson also thanked the British Broadcasting Corporation and Miss Marisa Robles, Mr. John Heddle Nash, Mr. Leonard Hirsch, and the New B.B.C. Orchestra for the concert on Sunday, and the Ciba Laboratories Limited, who made the concert possible; the President and members of the Bristol Medico-Chirurgical Society; the Librarian of the Medical School; Messrs. Frost and Reed; the Chief Constable of Bristol; Wessex Coaches Limited; the Automobile Association; Messrs. E. R. Squibb and Sons Limited; Messrs. Roneo Limited. Finally, he thanked those responsible for the floral decorations, particularly the Corporation Parks and Gardens Department, the students who had acted as stewards for the Meeting, and the staff of the West of England Regional Office of the B.M.A.

Dr. Stevenson said he was sure it would be the wish of the Representative Body that suitable letters of thanks be sent to all those who had made the success of the Meeting possible. (Applause.)

President of the American Medical Association

The CHAIRMAN introduced to the Meeting Dr. Milford O. Rouse, President of the American Medical Association, who before becoming President of the A.M.A. had been Chairman of its Board of Delegates, which corresponded to the British Medical Association's Representative Body. Dr. Rouse was given a standing ovation.

Dr. ROUSE said it was a privilege and a pleasure to bring to the Meeting the greetings and good wishes of the American Medical Association. The B.M.A. was the cousin of the A.M.A. not only in race but in service to mankind. It was comforting to know that the B.M.A. and the A.M.A. had common problems and the common objective of ever increasing the quality of medical care, while trying always to preserve the profession's freedom of judgement and freedom of action.

Other Motions by Divisions and Branches

Independence of the Review Body

Dr. J. R. B. TURNER (Leeds) moved: "That this Meeting records with dismay the recent attempt of the Government to undermine the independence of the Review Body, and urges Council to resist with all the means at its disposal any further similar attempt."

During the eight years of the Review Body's existence it had acted as a reasonable arbiter on remuneration. Its machinery had been more satisfactory to the profession than that of any of the previous methods of negotiation it had replaced. The profession had not always liked its decisions. Nevertheless the decisions had been accepted, and when the profession had felt wronged it had sought further evidence to support its claim. The profession had accepted those decisions because they had been made by a body of men of high individual and collective standing and of undoubted integrity, able to withstand pressure from one side or the other, a truly independent body.

In the recent White Paper on prices and incomes the Government had seemed to undermine that independence by bringing the Review Body either directly or indirectly under the remit of the Prices and Incomes Board. That would virtually bring the profession back to square one again, which must be strongly resisted. "The umpire is being got at, and the whole future of our pay negotiations is at stake," said Dr. Turner.

Dr. RONALD GIBSON (Chairman of Council) said that the Minister of Health had stated that paragraph 21 of the White Paper (Cmnd. 3235) implied no change in policy from similar statements used in previous White Papers, and the status of the Review Body was in no way affected by that paragraph. Accordingly, evidence had already been prepared and would be submitted to the Review Body in October on the assumption that the position of the Review Body remained unchanged. Dr. Gibson was prepared to accept the motion as a reference to the Council.

The motion was carried.

Remuneration

The CHAIRMAN moved formally a motion in the name of Medway and Gravesend: "That, in the opinion of this A.R.M., the overall level of remuneration contained in the 1966 Review Body award is too low to serve either as an incentive to recruitment or as a disincentive to emigration."

Dr. GIBSON said he was not against the motion, but was nevertheless a little worried by it. The Minister, in consultation with the profession's experts, was obtaining facts on both the points mentioned in the motion. It seemed unwise for the Representative Body to pass a motion in such terms knowing neither the effect of the award on general practitioners nor the rate of pay which the general practitioners would have under the new scheme. It would be better to obtain the facts first and then pass the motion, suggested Dr. Gibson.

A motion to pass to the next business was passed by the necessary majority.

The following motion by Bournemouth was, by leave, withdrawn: "That, mindful of the threat to all the professions that their fees may be referred to the Prices and Incomes Board, and being aware of the fact that the fees of architects have already been referred to that body, this Meeting instructs Council forthwith by all means at its command to obtain accurate up-to-date information on the realistic overheads of all forms of medical practice, private or N.H.S., in order to be able to justify before any Government body or to the public generally proper levels of gross fees required to provide a high standard of medical care to all patients."

A motion by Monmouthshire, "That the B.M.A. fully supports the public health medical officers and medical teachers in their present conflict over remuneration, and especially pledges its support in the event of their resignation," was accepted.

A motion by Tyneside, "That a contract entered into with a Government that has legalized the breaking of contracts is not worth the paper it is printed on," was accepted.

Profession's Leaders

Dr. C. C. LUTTON (East and Mid-Lothian) moved: "That in order that sufficient time may be spent by the profession's leaders on matters of importance in their negotiations and representations on behalf of the profession, adequate provision should be made for these leaders to absent themselves from their normal professional work; if necessary funds should be made available to provide for the employment of locums or deputies."

He said that earning daily bread in medicine was an onerous task, but earning other doctors' bread was more onerous. There were chairmen of committees who must be penalizing themselves in terms of promotion in hospital since they were so often away negotiating. The Health Service was going through a period of change and expansion, and therefore the work of the profession's negotiators was continually increasing and they were spending more and more time away from their work.

Any allowances that the profession's leaders received should not be charity but compensation for what they would have earned had they been working. He suggested that these doctors should be given official recognition for the work they did, and there should be a special fund available to which the leaders could apply if they were out of pocket.

Dr. GIBSON explained that there was already an *ad hoc* committee which looked into matters brought to its notice by officers or chairman of standing committees. He would be happy to accept this motion as a reference to the Council.

The motion was carried as a reference to the Council.

Public Opinion on N.H.S. Expenditure

Dr. A. W. MACARA (Junior Members Forum) moved: "That this Meeting has grave doubts whether the wishes of the public are being carried out in regard to the proportion of the national income spent on the N.H.S. That it be a recommendation to the Council of the Association to consider employing the modern techniques of sampling public opinion to obtain evidence of this question."

He said that politicians of all parties admitted that the finance available for the Health Service was inadequate. In the House of Commons on 9 June Members from both sides spoke of the need for an increase of as much as 40% in the National Health Service budget, which would bring this country into line with the United States in regard to the proportion of national wealth devoted to health. He suggested that it was time politicians and those responsible for dictating priorities did something about this. Dr. Macara said that he was confident that the public, given an opportunity to express its views, would demand that as national prosperity grew more money should be spent on the Health Service.

Dr. GIBSON said that the wording of the motion indicated that it should be a reference to Council. The proposal would have to be investigated from the point of view of expense and a report brought back to the Representative Body next year.

The motion was carried as a reference to the Council.

Medical Education

A motion standing in the name of Manchester, "That students receiving public money in the form of grants should be required to undertake to work in Great Britain for a period equal to the term of the grant or, in default, to repay a proportional amount of the grant," was, by leave, withdrawn.

Mr. D. B. BROWN (Mid-Essex) asked whether the motion he would put forward on behalf of Mid-Essex, asking for a central council for medical education, and the motion in the name of Morpeth and Blyth ("That in the view of the expansion and complexity of medical education, particularly in the postgraduate field, the Council of the B.M.A. is instructed to take steps to co-ordinate all bodies involved,") could be taken together.

Dr. GIBSON said it would be better to support the motion standing in the name of Morpeth and Blyth. A central committee had already been set up and the B.M.A. had been excluded. But the Association should not weaken in its determination to be represented on any bodies concerned with medical education.

Mr. D. B. BROWN (Mid-Essex) then moved the Mid-Essex motion: "That there should be set up a central council for medical education as a forum for discussion and negotiation on all matters relating to both undergraduate and postgraduate education."

Mr. Brown said that as medical education developed it had been urged increasingly that its further progress should be controlled by a central council. It was not surprising that undergraduate hospitals had dominated the thinking on medical education in the past, because it had been concerned mainly with students. However, opinion was changing, and it was now considered that greater emphasis should be placed on postgraduate education. There was inadequate co-ordination in the schemes that had developed and little liaison between postgraduate and undergraduate teaching. Mr. Brown said that the B.M.A. should now set up a central committee for co-ordinating postgraduate and undergraduate education. This would be a major step towards unity.

Dr. S. WAND (Treasurer) said that it sounded a very simple exercise, but in the words of the motion it could be a large and expensive undertaking. The motion standing in the name of Morpeth and Blyth indicated the kind of policy that the Association had been trying to carry out. He hoped that the Meeting would persuade the mover of the Mid-Essex motion either to withdraw it or to refer it to the Council in general terms, and pass the motion standing in the name of Morpeth and Blyth.

A motion to pass to the next business was carried.

The motion standing in the name of Morpeth and Blyth was carried.

Road Accident Service

Dr. E. L. R. MCCALLUM (Darlington) moved: "That this Meeting urges the Government to take responsibility in organizing a more efficient road accident service." Dr. McCallum said that last year the total number of road casualties in the country had been in excess of 392,000, of whom 100,000 had been seriously injured and 8,000 fatally injured. Twenty-two people were killed on the roads each day. It had become increasingly obvious that there should be a major controlling body of police, fire, ambulance services, and the rest which could act at once on matters of improved efficiency. Ambulances should be provided with positive-pressure oxygen-giving equipment, suction apparatus, various dressings of all sizes, portable floodlighting, and blood transfusion sets. If such ambulances attended at accidents any passing doctor could fulfil a vital role. All general practitioners should be trained to use such equipment. The important time was the period between the accident and the time of hospital admission. The injured should receive the best possible attention, but the equipment, and proper control of the equipment, was needed.

Mr. A. LAWRENCE ABEL (St. Marylebone) said that the number of serious injuries would be cut down and the death-rate reduced if the road accident services were better organized. "A larger number of those who are mutilated and murdered on the roads could be saved," said Mr. Lawrence Abel.

Dr. G. CORMACK (Newcastle upon Tyne) said he was in an area where it was twelve miles to the smallest cottage hospital, which was not adequately equipped to deal with local casualties. As a result, doctors were frequently asked to deal with road-accident casualties. The amount of help that could be offered was usually limited to little more than first aid. An improvement in the facilities immediately available to doctors at the scene of the accident would make a substantial improvement in the number of fatal casualties.

Dr. GIBSON agreed that the motion was important, and he had hoped there would be time for a debate. However, the Association would urge the Government to take action in the matter, and he thought it would be the wish of the Representative Body to invite the help of other bodies such as the Royal Colleges.

The motion was carried.

Dr. A. M. MAIDEN took the chair.

Notification by Police of Patient's Death

Dr. H. STOLL (Camden) moved: "That where the police are called following the discovery of a dead person then that person's doctor should be notified of the death by the police as soon as possible."

He said there were areas in the country, and perhaps more of them in the Metropolis, where it was possible to inquire about a person only to be greeted with the embarrassing reply, " Didn't you know she had been dead for the last three months ? Didn't the police surgeon tell you ? " Dr. Stoll thought that if the Association was to negotiate with the Home Office or with the Police Surgeons' Association to make sure that every death about which the police were called in resulted in a notification to the general practitioner a lot of embarrassing situations would be avoided.

The motion was carried.

Boxing

A motion moved by Dr. D. Buchanan (Dundee), " That this meeting deplores the continuing of professional boxing in this country and its resultant mental and physical damage," was, by leave, withdrawn.

Sterilization

Dr. B. Taylor (Tower Hamlets) moved: " That, as all methods of contraception appear to have their drawbacks, this Meeting considers that the time is due for the medical profession to consider the question of the legality of sterilization and help to form the law by deciding its view of what the law ought to be."

He stated that in the past, and before the reformers got to work, the medical profession had given insufficient consideration to the question of what ought to be the law on abortion. The profession had given even less thought to the law relating to sterilization for either sex.

Dr. Doris M. Odlum (Bournemouth) could not support the motion and hoped that the Meeting would pass to the next business. No issue had been raised on this point and she thought it unfortunate to create laws which also created offences. If in future there was a charge of a criminal nature brought against a doctor for performing a sterilization, then there would be a case for considering whether it should be legalized. " But as the situation is completely fluid," she said, " and nobody has ever suffered from the absence of such a law, I deprecate the raising of the issue at all."

Dr. Gibson said that the Representative Body must have the last word on this matter. He could accept it as a subject that the Medical Science, Education, and Research Committee and the Central Ethical Committee should examine and on which a report could be made to the Representative Body in 1968.

The motion was carried as a reference to the Council.

Professional Independence and Freedom of Choice

Dr. G. R. Smith (Birmingham) moved: " That this Meeting agrees that the policy of the Association shall be: (i) freedom of the doctor to choose his patient ; (ii) freedom for the patient to choose his doctor ; (iii) freedom for the doctor in his clinical assessment and therapy ; (iv) that the doctor be entitled to a fee from his patient where the payment made by the State is considered by the profession to be inadequate for the services rendered ; (v) freedom for the patient to avail himself of all or any relevant services available within the framework of the welfare state."

Dr. Gibson said that he accepted items (i), (ii), and (iii). They were already Association policy.

Dr. Smith explained that, though doctors in this country accepted many of these things as " just one of those things " and nothing to worry about, these were the very points that doctors in Europe at present were coming under pressure about from their own Governments.

Item (iv) was important. " It is time the profession in this country stood up and said, ' We are professional men. These are our fees. If the State will only pay this proportion of our fees then the patient pays the remainder.' " The profession in this country had failed for too long to stand on principles. This was a principle on which it could no longer afford not to stand.

With regard to the fifth item, time and again representatives came to the A.R.M. and discussed drugs for private patients. He preferred to talk about drugs for all patients.

The spirit in which he put these items was " The B.M.A. shall not enter into any negotiations nor conclude any agreements that are in any way contrary to these freedoms."

Dr. K. S. Maurice-Smith (Isle of Ely) said he hoped that, if nothing else, a young man coming for the first time to the A.R.M. would learn that the one precious thing the medical profession must never give up was freedom.

Dr. Gibson said that the principle that a doctor was entitled to a fee from the patient was already B.M.A. policy. A resolution to this effect had been passed at the Annual Representative Meeting in Swansea. If Dr. Smith would accept that the second part of the motion meant that the Council should bring pressure to bear on the Government to ensure that the profession was paid adequately for the services it rendered he had no objection. However, it was difficult to interpret the second half of the motion as presently worded.

Dr. Smith, in reply, asked how long doctors were to go on putting pressure on the Government. When would they start saying, " These are the terms, these are the conditions, this is the medical profession you are talking to, and these are our fees. If you pay this proportion, the other proportion has to be paid by someone else." The spirit of the motion was that the B.M.A. should not enter into any negotiations nor conclude any agreements that were in any way against such freedom. He said that he accepted Dr. Gibson's interpretation of the motion.

The motion was carried.

A motion by N.E. Suffolk, " That this Representative Body reaffirms its utter opposition to an encroachment on a doctor's traditional freedom to prescribe for his patients as he sees fit," was carried without debate.

Index of Drugs in Hospitals

A motion by Finchley, " That the British Pharmaceutical Society index of drugs should be readily available in all hospitals to hospital medical staff and visiting general and specialist practitioners," was also carried without debate.

Publication of Annual Report of Council

Dr. J. M. W. Sedgwick (East Herts) moved: " That in view of the increasing length and complexity of the Annual Report of Council, Council be requested to issue the report in such time so as to provide at least one more week for its consideration."

He said that there had been some difficulty lately in persuading members of his Division who were not members of the executive committee to attend a meeting when the Annual Report of Council was being discussed. This was partly owing to the daunting prospect of trying to digest the whole of the report of 80,000 words. He suggested that the report should first be discussed by the local divisional executive committees, which would draft some motions. Those could then be given prominence in the letter sent round to members, with the proviso that other resolutions could be discussed. That would be impossible in 17 days, but it could be done in 24 days. The Council might have to compress some business, but the change would produce dividends in an increased peripheral participation in medical affairs.

Dr. Gibson said the problem was not so much compressing the work of the Council as of staffing and clerking. The Council would have to compress the timetable by an extra week or fortnight.

The motion was carried.

Duration of Special Representative Meetings

Mr. R. J. Williams (North Glamorgan and Brecknock) formally moved: " That the duration of a Special Representative Meeting should not be decided until the number of motions to be discussed is known."

The motion was carried.

Information Services

Dr. C. C. Lutton (East and Mid-Lothian) moved: " That in the interests of strengthening the services of communication and information the " B.M.A. News " should be developed and published regularly as a professional medical newspaper."

He said that the Association's information services must surely be developed further and brought really up to date. If they had been, there would not have been the incident of the Junior Hospital Doctors' Association on Saturday. The *British Medical Journal* was a wonderful publication for selective readership, but not all its subscribers were members of the British Medical Association. Other organizations provided " medical fringe publications." Surely the B.M.A. should do the same, said Dr. Lutton. Newspapers often made slanderous attacks on the Association and what did the B.M.A. do about it? It turned the other cheek. Many of those publications would go out of business if the B.M.A. had a good publication. They had had a few irregular issues of "B.M.A. News," but he thought the B.M.A. should go further. He did not ask its leaders to run a newspaper, but there would have to be a new voice that would deliver stimulating views. A revolution was taking place in the medical newspaper world, and the Association should get advice on how to produce a news sheet, with advertising, so that there would be little expense to the Association.

Dr. B. D. Morgan Williams (South Warwickshire), endorsing what Dr. Lutton had said, said it might look as though the B.M.A. was trying to keep up with the "Joneses—the fringe journals." Those journals had got a long start, but he thought the B.M.A. could beat them.

Dr. S. Wand said that "B.M.A. News" was costing the Association £1,100 an issue. If the number of issues exceeded six a year the advertising would be likely to fall off, and the cost would be proportionately greater.

Dr. J. L. McCallum (Council) said he thought the matter should be looked at carefully. The cost of a newspaper published regularly would be "pretty high." It would need a lot of work to produce. It had been done by the American Medical Association, but it would cost a lot of money, would need extra staff, and might even clash with the *British Medical Journal.*

Dr. Ronald Gibson said the subject was worrying. Clearly the information services must be strengthened and developed, but there were snags, not only from the point of view of money but also of advertising. Another snag was that, even with a professional editor, the Secretary must have effectual control of material put out.

Dr. Lutton said in reply that the quality of the newspaper depended on its editorial comment, and that meant "journalistic art." He thought the B.M.A. must have something that came out regularly. If the motion was accepted as a reference to the Council no doubt his Division would put it up again next year.

A motion to pass to next business was carried.

The following two motions by Bournemouth were by leave withdrawn:

"That this Meeting believes that the reports of Council proceedings appearing in the *Journal* are unduly limited by space. In view of the fact that, while all members of the Association may attend Council meetings, few have time to do so, this body instructs the Council to maintain for the inspection of members at all times a verbatim report of the proceedings of Council and to arrange for copies of such reports to be made available to any member of the Association on payment of a suitable fee to cover duplicating and postage."

"That this Meeting asks whether agreed minutes are kept of all discussions between representatives of standing committees or of Council and any Minister of the Crown or representatives of his department. If such minutes are not kept this Representative Body instructs Council forthwith to see that this is done and that such minutes are made available to members of Council."

Decisions of Representative Body

A motion by Bournemouth, "That this Representative Body notes with approval the statement by the Chairman of Council that 'the decisions of the Representative Body are sacrosanct' [*Supplement,* 29 October, p. 167], and believes that this body has an important part to play in ensuring that the views of all members of the Association are kept constantly before Council," was carried without debate.

A motion by Exeter, "That this Meeting requests Council to explain why the Resolution No. 330, 'That this Meeting wishes to draw the attention of B.M.A. members to Medical Management Services Ltd.,' passed overwhelmingly by the Representative Body in July 1966 does not appear in the Annual Report of Council," was withdrawn.

Dr. Ronald Gibson thanked Dr. Derek Stevenson and his staff for all that they had done during the past year.

Dr. A. N. Mathias resumed the chair.

Organization Committee: Constitution (Resumed)

The Chairman said that the Agenda Committee had gone into the details of the various motions on the constitution carried on Saturday. There was some conflict in the decisions taken and a complex position had arisen. The Chairman of the Organization Committee would speak to the Meeting in order to present the facts of the position. After that the Meeting would go back to complete the debate on organization.

Statement on Position

Dr. J. S. Noble (Chairman of the Organization Committee) said the motion in the name of East Yorkshire, asking that its memorandum should be referred to the Council, had been passed. It had been agreed not to refer back the report of the Organization Committee. The Representative Body had said that its sovereignty and its power to consider any matters reported to it were paramount, but at the same time it had approved the rationalization of the relationships between the Representative Body and the Council on the one hand and the autonomous committees on the other. The Representative Body had decided that its total size should be about 538 persons. The Meeting had also decided that in future at least 21 elected representatives should come from the hospital junior staff elected from the areas of the regional hospital boards. The Representative Body had approved of the mandatory scheme for flexible allocation to achieve proportional representation in elections. This would be given effect and reviewed at the end of two years. The Meeting had revised By-law 40 in the matter of the Representative Body and also the proposed schedule of the constituencies of the Representative Body. The motion by the Central Consultants and Specialists Committee had been agreed, which laid down that where large constituencies had second and reserved hospital seats on the Representative Body they would be reserved in respect of both senior and junior hospital staff.

The nub of the matter was in the two motions by Rugby on the size of the Representative Body. A further motion (312) by Rugby, which had been carried, had fixed the size at 538—and that figure was to include representatives from the hospital junior staff, 10 appointed by the Council to represent small minorities, and further minority representatives to represent public health, teachers, and so on. The figure of 538 had been intended to be the overall figure, a figure close to the existing Representative Body. An arithmetical formula which controlled the numbers which each Division elected could reduce their total number by the number of new members representing the minorities. The Representative Body wished the size to be 538, but the by-laws which it had amended would produce a Representative Body of between 625 and 629 members. The Solicitor had advised that the by-laws were the overriding factor.

Consequences of Decisions

The present scale was one representative for 50–150 members, plus one more for each full 100 thereafter, said Dr. Noble. The motions in the name of Rugby, as amended, proposed to raise the latter figure of 100 to 200. A further consequential amendment had been tabled to the remainder of the report to extend the schedule governing the proportional representation system to include the larger constituencies. That was consequential on the Representative Body's decision not to accept the system, but there would already be constituencies with eight, nine, or ten members.

So the positive decision taken on the motion in the name of Rugby, "That the overall size of the Representative Body should be about 538 members," and the negative ones taken on the later motions by Rugby were in conflict. The Representative Body must decide.

If the Representative Body thought that it had inadvertently made a decision that was in conflict with that which it had tried to achieve it could reconsider that decision.

The Chairman asked the Meeting if it wished to reconsider its decision, and pointed out that if it did there must first be a motion properly proposed and seconded to suspend the standing orders.

A motion to suspend standing orders was carried.

Size of Constituencies

Dr. R. P. Hendry (Rugby) moved: "That every U.K. Division having not less than 50 members may continue to form a constituency, but that the basis for the allocation of seats be changed to be one representative for the first 150 members and one additional representative for each additional 200 members or part thereof."

It had been agreed, he said, that the Representative Body should be genuinely representative of all fields of practice. There had to be various special electoral groups to elect the representatives of minorities. But that decision had increased the size of the Representative Body by 48.

Dr. Hendry said he had suggested that by varying the number of members that qualified a Division to appoint a certain number of representatives it was possible to get a Representative Body of whatever size was wished. The motion therefore suggested that if all constituencies retained their existing rights to one representative any Division having 151 or more members would be entitled to a second member. Instead of having one member per 100 seats, a Division would have to have 200 extra members to get an additional seat. Dr. Hendry said it would be hard, on small Divisions to be knocked down from one representative to none. It would not be a terrible hardship for large Divisions to be knocked down from five to four.

Figures in Dispute

Dr. R. L. Luffingham (East Yorkshire) maintained that it was the figures that were in dispute. The first part of the motion was that each United Kingdom Division having not fewer than 50 members should continue to form a constituency, which seemed right. It was agreed the approximate figure on which to work was that the basis for calculation should be changed to one representative. However, to achieve the overall figure of 538 the figure of 150 might have to be altered to 148 or 175. The Organization Committee would have to do that during the coming year. If the Meeting passed on to the motion immediately after in the name of Rugby, which made the motion under discussion mandatory, it would be possible for the Organization Committee to come back the coming year with the figures corrected. "This is what we are suggesting might well be done," said Dr. Luffingham.

Dr. H. B. Muir (Council) said he had no doubt that the Representative Body had grown far too big, a tendency which had continued from year to year. The formula contained in the motion under discussion was in his view a reasonable one.

Dr. W. P. Lambie (Sheffield) said that the Meeting had agreed to accept, somewhat reluctantly, mandatory proportional representation from Divisions. The Meeting had been told that one section, the hospital junior staff, would be in a position to appoint 21 representatives. That must be at least a factor in producing the excessive size of the Body. In his view the Meeting was at present going too far in appeasing certain sections of the profession to the detriment of Divisions, which would lose representation.

Dr. Noble pointed out that the approach to this matter from the start had been to obtain fairness for everyone in achieving a structure truly representative of the whole profession within a reasonable size. As a result of Dr. Hendry's motion there would probably be a tendency for the number of single constituencies to increase, and that would give greater representation from one section of the profession. That would to a certain extent be balanced by the direct representation of hospital junior staff. The formula would be reviewed in two years.

Dr. Hendry explained again that if the motion was not accepted a mathematical impasse would be produced.

The motion was carried by the necessary two-thirds majority.

Amended Clause

Dr. Hendry (Rugby) moved: "That By-law 41 be not deleted but clause (2) be amended thus: Delete words from '. . . for each complete . . .' to end of paragraph and add 'and one more for each complete number of 200 members in excess of 150 members.'"

Dr. Luffingham (East Yorkshire) asked if that was not the amendment of a by-law, for which four weeks' notice was required.

Dr. Hendry (Rugby) said that it would be perfectly simple to say that the motion should be voted on in two parts. He begged leave to withdraw part 1, that the figure be 175 instead of 150. The second part then became a consequential amendment. That made it perfectly legal, because the second part became a consequential amendment which would comply with the decision already made.

Mr. N. Leigh Taylor (Solicitor to the Association) said that it was in order for the proposed amendment to the by-law to be amended in the way it had.

The Chairman ruled that the motion could legally be amended in the sense that it had been moved by Dr. Hendry.

Dr. Noble hoped that the Representative Body would pass the motion.

The motion, as amended, was carried.

The Chairman announced that the suspension of standing orders had now ended.

Elected Members of Council (Continued)

Dr. Doris M. Odlum (Bournemouth) moved: "That this Meeting resolves that 10 members of Council shall be elected annually, as heretofore, by the Representative Body."

This proposal gave an opportunity, she said, to elect members of standing and experience who otherwise would not be on the Representative Body.

Dr. Noble accepted the motion.

Dr. H. S. Howie Wood (Isle of Wight) said that the Representative Body had always been jealous of its right to elect to the Council members who had not been elected by the constituencies and who it thought were deserving to continue to serve. The right should be preserved.

Dr. C. C. Lutton (East and Mid-Lothian) moved as an amendment: "That under the new constitution the members of Council directly elected by the Representative Body be increased from five to ten, of whom not more than seven shall be representatives of constituencies in England, and of these seven not more than four shall be from the same category as defined in the proposed By-law 40 (2)."

He said that if there were to be proportional representation, so that the smaller areas might not be too swamped, it would be reasonable to have seven elected from England, presumably two from Scotland and one from Wales. Northern Ireland should not be forgotten, but it could speak for itself.

Dr. Noble said that two for Scotland out of the ten was a high proportion, but, subject to the ruling of the Representative Body, he would accept the motion.

Dr. D. L. W. Chapman (Northern Ireland) said that if the representation was to be raised to ten Northern Ireland should have one representative. Dr. J. S. Happel (Council) asked if the motion were not intended to apply to England and Wales only. Dr. Lutton replied that there was obviously doubt about the detail. The intention was that the Representative Body should continue to have the right to elect, and those it elected should come from various parts of the United Kingdom. Dr. B. L. Alexander (Manchester) said that "ten members as heretofore" meant ten members from England and Wales as heretofore.

Dr. R. H. Scott (Norwich) thought that the ten members elected by the Representative Body had nothing to do with geographical areas.

Dr. Doris M. Odlum (Bournemouth) was not in favour of the amendment. The ten were elected on a free vote of the Representative Body as a whole. It was a new idea to introduce proportional representation. Dr. D. J. P. Gray (Exeter) supported the original motion. It was impossible to apply the slide rule to a number as small as ten. Dr. G. R. Outwin (Council) opposed the amendment on the ground that Scotland would be able to have its own representaiton.

The amendment was lost.

Geographical Representation

Dr. W. R. King (North Glamorgan and Brecknock) moved as an amendment: "That, of the five members of Council proposed under the new constitution to be elected at the Annual Representative Meeting, three should be elected by the Representative Body as a whole and one each by the Scottish and Welsh representatives respectively."

He said he presumed that the reduction had been suggested on a basis of the number of the doctors in Wales. That was false reasoning. He pointed out that the geographical conditions in Wales and Scotland made it impossible to maintain efficient contact. Hard rules could not apply where unusual circumstances and terrain prevailed.

Dr. J. S. Ross (Council) said he had seen a lot of Wales and been told much about its difficulties. The Council went all the way with Welsh doctors on this. The B.M.A. was trying to make arrangements for vast improvements in the office in Cardiff and was providing a regional medical secretary to do all the things Wales was asking for.

Dr. Outwin (Council) supported Dr. Ross, and pointed out that the amendment was not a valid one to the motion.

Dr. Doris M. Odlum (Bournemouth) pointed out that if the matter was left to a free vote outstanding doctors in Wales would have an equal chance of election with those in England. The matter must not be treated sectionally.

Dr. Noble said that the Organization Committee would be watching every anomaly.

Dr. W. R. King, in reply, said that in Wales doctors appreciated the fact that Headquarters was taking more interest in them. It had influenced doctors who were nonmembers of the Association. "Having gained this ground," he said, "why voluntarily surrender some of it by removing one member of Council from Wales, thereby weakening the communication between the periphery and Headquarters instead of further strengthening it?"

The amendment was lost.

Dr. B. L. Alexander (Manchester) opposed the motion and hoped that the Representative Body would carry on as it had been doing.

Dr. Doris M. Odlum, in reply, pointed out that the ten members elected by the Representative Body had always been appointed on a free vote, never on a proportional basis. The individuals were chosen entirely on their merits.

The motion, "That this Meeting resolves that ten members of Council shall be elected annually, as heretofore, by the Representative Body," was carried.

President-Elect

The Meeting received Dr. John W. Howie (President-Elect for 1968–9), who was accorded a standing ovation.

Dr. Howie thanked the Meeting for electing him and said: "It will be with great pleasure that I will try to discharge the duties of President in Aberdeen in 1969."

Constitution (Continued)

Constituencies for Election of Members of Council

Dr. Noble formally moved: "That the proposals published in Appendix III of the revised Report on the Constitution of the B.M.A. be amended as follows: (i) The East Herts Division be transferred from Council constituency No. 6 (N.E. Metropolitan) to constituency No. 5 (N.W. Metropolitan), and that an additional member of Council be allocated to Council constituency No. 5. (ii) The Council constituency No. 11 be divided into two—namely, South-western Branch (one representative), Bath, Bristol, and Somerset Branch, and Gloucestershire Branch (two representatives)."

Dr. J. A. Jamieson (West Herts) moved an amendment: "To add, following 'No. 5' in line 7 at the end of the second paragraph, 'and that it be divided into two, namely, (*a*) Bedfordshire, Hertfordshire and Thames Valley (one representative); and (*b*) the remainder (four representatives).'"

The amendment was accepted.

Dr. C. D. L. Lycett (Public Health Committee) moved an amendment: "After the words 'Gloucestershire Branch' add 'Trowbridge Division.'"

Dr. Lycett said the effect of the amendment would be to include the Trowbridge Division in the new constituency for the regional council with Bath and Bristol. It was now the policy to relate B.M.A. regional organization with that of the hospital service. Wiltshire was unusual in being split between three regional hospital boards, each of the B.M.A. Divisions being in a different hospital Division. The Trowbridge Division, which covered West Wiltshire, was firmly linked with Bath and Bristol for hospital and other purposes, and ought to be included in the suggested regional council constituency.

The amendment was carried.

The motion as amended was carried.

Dr. A. E. Loden (Tunbridge Wells) formally moved: "That, with reference to paragraph 213 of the Annual Report of Council, the proposals published in Appendix III of the revised report on the Constitution of the B.M.A. be further amended as follows: That Council constituency No. 7 (South-east Metropolitan) be allocated three members of Council."

The motion was carried.

Dr. Charlotte C. Arnold (Belfast) moved: "That in the proposed new constitution of Council Northern Ireland should have two elected members of Council as hitherto."

Dr. Arnold said that there was concern that the representation of Northern Ireland would be reduced by 50%, from two to one elected member of Council. "How could one representative effectively represent the interests of general practice and the hospital service," asked Dr. Arnold. Northern Ireland was not asking for an extra member but that the Northern Ireland constituency should have two members of Council with full voting rights.

Dr. Noble said Northern Ireland had 1,400 members. They had one representative on the Council. They also had a chairman of the Northern Ireland Committee who as a chairman of a standing committee would be a non-voting member of Council.

Mr. W. Mathews (North-east Ulster) asked the Meeting to compare the Council member ratio in two areas. Area 11, South-western region, with a B.M.A. population of 2,700, had three representatives; Northern Ireland, with 1,400 members, had a representation of one.

The motion was lost.

Chairman of Council

The motion standing in the name of East Yorkshire, "That, with reference to the proposed alteration of By-law 75, the Chairman of Council, or his nominee, be asked to explain to this Meeting why it is proposed that By-law 75 shall be amended when no reference to this change is to be found in the Annual Report of Council, on in the 'Report on the Constitution,'" was, by leave, withdrawn.

A motion standing in the name of East Yorkshire, "That no alteration to By-law 75 along the lines proposed in Appendix XIII of the Annual Report of Council shall be made until this proposal has been fully discussed in Divisions and Council itself, and reaffirms present policy that 'The Chairman of Council shall be elected by the Council from its own number,'" was carried.

Term of Office

Dr. R. L. Luffingham (East Yorkshire) moved: "That the proposed new By-law 65 paragraph 2 be amended by the deletion of the words 'elected under paragraphs (*c*) and (*h*) of By-law 56' in lines 2 and 3; and that the new paragraph 3 be deleted in its entirety; and that the amendment to By-law 65 (*a*) (i) be withdrawn; and that the amendment to By-law 65 (*a*) (iii) be withdrawn."

The motion, said Dr. Luffingham, was a request to the Representative Body to reverse its decision last year, and it dealt with the question of the length of time a member of Council might serve and how often he might be re-elected. It was proposed that a member of the Council should serve for two three-year terms. He would have to be re-elected, and his Division might not be able to "get rid of him for three years." It might have to elect second-best or, if it did not get anybody to stand because nobody wanted to accept the seat, the seat would remain empty for three years. The constituency should have the right to elect its best candidate and to get rid of him if it did not like him at least yearly.

Dr. Noble said it had been approved by the Representative Body that in future elected members of the Council should serve a three-year term, and that after six years' service a member should be ineligible for election for one year. Two terms were considered to be a reasonable time. On the other hand, if a member was really good and contributing to the Association in an outstanding way he could then stand for election by the Representative Body.

Mr. Robert V. Cooke (left), President of the B.M.A., Professor Hamid Ali M. Khan (centre), and Mr. A. Lawrence Abel before they received their honorary degrees at the University of Bristol.

Dr. LUFFINGHAM, in reply, said the policy was a mistake in the sense that the needs, desires, and wishes of the candidate were being put before those of the constituency. He urged the Representative Body to reject the proposals made at Exeter and asked them to support the motion.

The motion failed to achieve the necessary two-thirds majority and was therefore lost.

Dr. LUFFINGHAM (East Yorkshire) moved: "That the proposed new By-law 65A be amended by the deletion of all the words after 'term of office' in line 3."

The motion was lost.

A motion standing in the name of Worcester and Bromsgrove, "That the maximum number of consecutive years' service on the Council for any constituency member should be nine years," was, by leave, withdrawn.

Brains Not Age

Dr. A. M. SPENCER (Worcester and Bromsgrove) moved: "That this Representative Body is of the opinion that membership of Council should cease at the age of 70."

He said that in the interests of the Representative Body as a whole, there should be some upper age limit for the members of Council. Without it the progress of the younger members to the Council might be limited.

Describing it as "an eminently sensible motion," Dr. M. SIM (Birmingham) said the only criticism he had to make of it was that the age should not be 70 but 65. However, 70 had been included in the motion and a start must be made somewhere. In industry, commerce, the health service, and even among the B.M.A.'s excellent officials, the retirement age was 65; but there were some people who seemed to think a certain grace was gained when people attained Council status and that they could go on for ever. What he had said was not to be taken as any criticism of the present Council members; they were extremely good, but what he would like to have would be Council members in their prime.

Dr. J. C. MCCALLUM (Council) said members should be elected on their merits.

Dr. DAVID BROWN (Liverpool) said he had been a member of the Council, and well before the age of 70 he had found his powers failing, his hearing going, and his sight getting poor, and he had found that when he made a speech the Council were bored with him, and when they made speeches he was bored with them. The journey to London became more hazardous, and he felt in his bones that it was time to go, because his colleagues would throw him out anyway. While he was on the Council two of the best members serving with him were Guy Dain and Thomas Horder, and each was over 70. It did not depend on age but on brains.

Dr. A. W. MACARA (Junior Members Forum) moved as an amendment to insert the word "normally" between "should" and "cease."

Dr. NOBLE said if the word "normally" was inserted who was to decide the issue?

The amendment was lost.

Dr. NOBLE said that the motion had great attractions. He believed the Council attained its greatest strength when it combined both young and old in its membership and when it represented the whole profession. He agreed with what Dr. David Brown said.

The motion was lost.

Two Consecutive Terms

Dr. J. B. MACFARLANE (Halifax (with Todmorden)) moved: "That after serving two consecutive terms a member of a central committee (including the Council) or an honorary officer should be ineligible for re-election during a further term."

He said the object of the motion was to fix a limit to the period of service in any office or on any committee and, in fact, as a representative. His Division had been asked to submit its ideas to B.M.A. House, but unfortunately the correspondence took longer than expected and the Division was unable to substitute a motion which appeared as an amendment, which read: "That with the aim of combining the benefits both of reasonable continuity and infusion of new ideas, the Council be requested to investigate the question of terms of office and eligibility for re-election as they affect officers, representatives, and committee members throughout the Association, centrally and locally, and to report the recommendations."

By accepting the proposal the Meeting would bring a fresh point of view into the deliberations of committees and other bodies of the Association. The dissatisfaction of the younger members of the profession and, indeed, much of the apathy generally and lack of interest within the Divisions was due to the feeling—however ill-informed—by those on the periphery that the B.M.A. was in the hands of a self-perpetuating caucus. They saw the same names on the same committees year after year, both centrally and locally.

The amendment having been accepted by the Meeting as the main motion, Dr. NOBLE said he was prepared to accept it if it were made a reference to the Council. The Council, he said, would investigate the question of service on committees.

The motion was passed as a reference to the Council.

Agenda Committee

The following motion by Cumberland was withdrawn: "That under the new constitution the A.R.M. Agenda Committee should have six members directly elected by the Representative Body, exclusive of the Chairman and Deputy Chairman of the Representative Body."

Dr. G. E. CRAWFORD (Liverpool) moved: "That the Agenda Committee should consist of the Chairman and Deputy Chairman of the Representative Body, the Chairman of Council, and six representatives not members of standing committees."

He said that the Meeting had reaffirmed that the Representative Body was the policy-making body of the Association. The most important committee of the Representative Body was its Agenda Committee. He had no criticism of the present Agenda Committee, but he believed that in the coming years it was going to have to take more and more unpopular decisions. It would be to the advantage of the Representative Body that the Agenda Committee should be completely independent of any other committee and responsible only to the Representative Body.

Dr. A. M. RANKIN (Council) supported the motion.

Dr. NOBLE said that the composition of the Agenda Committee was a matter for the Representative Body to decide.

Dr. CRAWFORD, in reply, said that Liverpool wanted the Agenda Committee to be completely independent and subject only to the Representative Body.

The motion was lost.

Approval of Revised Report on Constitution

Dr. NOBLE formally moved: "That, subject to any amendments arising out of the decisions of the Meeting, the revised Report on the Constitution of the B.M.A. be approved."

Dr. Noble thanked Dr. David Gullick for the tremendous work he had done on the Constitution Report.

Dr. B. TAYLOR (Tower Hamlets) moved an amendment: "That in the event of the amalgamation of Redbridge and Stratford Divisions, Council has power to make the necessary constituency adjustments without delay."

Dr. NOBLE accepted the amendment, but thought that in view of earlier decisions already taken it had no significance.

The amendment was carried.

Request for Delay

Dr. R. L. LUFFINGHAM (East Yorkshire) moved an amendment: "That, with reference to paragraph 213, recommendation 3, of the Annual Report of Council, no implementation of alterations to the present constitution provided for in the Annual Report of Council and the Report on the Constitution (*B.M.J.*, 26 November 1966) shall take place before the Memorandum on the Reform of the Constitution submitted by the East Yorkshire Branch shall have been considered by Council, and reported on at the A.R.M. 1968. Provided that nothing in this resolution shall prohibit the coming into force of the following:

> "By-laws 1, 9, 10, 16, 43, 59, 60A, 68, and sections (*d*), (*e*), (*f*), (*g*), (*h*), and (*i*) of 56. Or the alterations to the proposed Second Schedule, or the Amendment of Standing Orders of the Representative Body 9, 11, and 29."

Dr. Luffingham said that earlier he had prepared a speech to the effect that "We should fight on the beaches of Eastbourne, the fields of Leicester and of Aberdeen, and in the streets of Tavistock Square and should not give in"—a speech which was no longer necessary because the Representative Body had produced the delay that East Yorkshire had thought desirable. Substantial changes had been made in the revised report on the constitution. Some of the decisions could not be carried out: it would be impossible to get 14 additional chairmen of standing committees into the Council Chamber in 1967.

One very important constitutional change had been allowed to disappear altogether. The Chairman of the General Medical Services Committee had said, without a murmur of dissent from anyone, that the G.M.S. constitutional proposals had been withdrawn. The profession was moving much nearer a cohesive situation. The points of difference were much nearer to being ironed out than they had been previously. He sincerely believed that if the amendment was passed there would be no more delay than was already inevitable as a result of decisions already taken on the very same day.

Dr. Ronald Gibson said that if the amendment was passed it would put the clock back another year. He hoped the Representative Body would show its sovereignty and instruct the Council to get on without further delay.

Dr. D. C. Roberts (Hendon) opposed the amendment. He said that the Meeting had given its instructions as to what it wanted for the new constitution. It was now a matter that must be left to those who had been elected to work it out. Dr. G. R. Outwin (Council) said that the mistakes that had been about to be made had been pointed out, but the changes made could not be written into the constitution just like that. How it looked in full must be examined again next year. It might be that the clock was being put back, but that had already been done.

Dr. Noble said that on the third day of the Meeting there had been a recommendation from East Yorkshire that the report on the constitution should be referred back. The motion had been defeated. Did the Meeting wish to return to the matter again next year? Dr. Noble said he believed the majority of representatives had made up their minds.

Dr. Luffingham, in reply, said that the constitution had lasted for 60 years, and yet in the last 60 months it had suddenly become so unsatisfactory that another 12 months to look at it could not be afforded. That he could not accept. He sincerely believed that there would be delay year after year as the effects of the small print in the constitution became apparent. He urged the Meeting to accept the amendment.

The amendment was lost.

The motion by the Chairman of the Organization Committee was carried, together with the Tower Hamlets amendment.

That concluded the debate on the constitution of the B.M.A.

•

Autonomous Bodies

Dr. Noble formally moved: "That the autonomous powers of the General Medical Services Committee and the Central Consultants and Specialists Committee be renewed in respect of the year 1967–8 on the understanding that no action be taken by either of these Committees which may prejudice the interests of another part of the profession without full prior consultation with the interests concerned and that their autonomous powers will be used so as to expedite the work of the Association."

The motion was carried without debate.

Amendments to Articles, By-laws, and Standing Orders

Dr. Noble formally moved: "That the Schedule to the By-laws relating to the Organization Committee be amended so as to make it clear that the member of Council elected by the Junior Members Forum is an *ex officio* member of the Organization Committee."

The motion was carried.

Card Vote at Representative Meetings

Dr. Noble formally moved: "That By-law 52 (4) be amended by the addition of the words 'and of the Hospital Junior Staffs Group Council and of the Assistants and Young Practitioners Subcommittee of the General Medical Services Committee' immediately following the words 'Central Consultants and Specialists Committee.'"

The motion was carried.

Dr. Noble formally moved: "That, subject to any amendment arising out of the decisions of the Meeting, the Articles, By-laws, Schedule to the By-laws of the Association, and the Standing Orders of the Representative Body be altered in the manner shown in Appendix XIII, and that Council be instructed to submit the amendments of Articles concerned to an Extraordinary General Meeting of the Association."

The motion was carried.

Dr. Noble moved: "That the remainder of the Annual Report of Council under 'Organization' be approved."

The motion was carried.

Change of Address Cards

Dr. F. O. Wells (East Suffolk) moved: "That this Meeting notes with regret that many junior and newly qualified members of the Association are frequently not notified of the activities of the Division or Branch in the area in which they are working, and suggests that it would be in the interests of the Association to encourage better contact with these members by issuing them with pre-paid notification cards for them to notify the Association of their changes of address, which notification should be passed with a minimum of delay to the appropriate Division or Branch Secretary."

The motion was carried as a reference to the Council.

•

Annual Report of Council

Dr. J. M. Wallace (City of Aberdeen) moved: "That a shortened and summarized version of the Annual Report of Council be published and circularized to all members in addition to the publication of the full report in the *British Medical Journal.*"

He said that the Annual Report was one of the most important documents produced by the Association, but it got lengthier every year. This year it ran to 52 pages, plus 20 pages of appendices, and it was difficult to find time to read it. Dr. Wallace said surely it was in the interests of the B.M.A. that a shortened version should be published, which would more readily come to the attention of all doctors. It was a document that needed to be read by all doctors. He would be prepared to take the motion as a reference to the Council, if that would help.

Dr. Ronald Gibson said he preferred not to take the motion as a reference to the Council, or indeed to take it at all, because it was an impossible exercise, even if it were a desirable one. Who would do the summarizing of the report? The summary might suit him, but it might not suit various standing committees. He hoped the Meeting would not refer the motion to Council.

Dr. S. Wand supported Dr. Gibson and added that summarizing the report would be "a very expensive exercise."

Dr. Wallace, in reply, submitted that the suggestion should at least be considered.

The motion was lost.

(The A.R.M. thereupon adjourned for the Annual General Meeting of the Association and an Extraordinary General Meeting.)

Mr. A. Lawrence Abel (left) receives the honorary degree of Doctor of Medicine conferred on him by the Duke of Beaufort, Chancellor of Bristol University, in the Great Hall of the University.

Medical Science, Education, and Research

Mr. A. LAWRENCE ABEL (Chairman) moved: "That the Annual Report of Council under 'Medical Science, Education, and Research' (Doc. A.R.M. 2, paragraphs 181–194) be received."

He said that the B.M.A. had organized successful one-day meetings on the subject of computers in medicine. It was hoped to arrange follow-on courses, probably of four days' duration. Mr. Lawrence Abel said that there had also been a joint symposium during the winter with the Institute of Mathematics on the application of mathematical and computer methods to problems in medicine. The Annual Report of Council had already stressed the successful one-day conference on first aid held at B.M.A. House, and a similar conference in Glasgow was to be held at the beginning of the new session.

Work in the Nuffield Library had increased. B.M.A. lectures were available to postgraduate medical centres under the sponsorship of B.M.A. Divisions, to Branches, and to medical students' societies.

Mr. Lawrence Abel called attention to the B.M.A. Research Fellowship, which it was hoped would attract candidates in the registrar grade. The Fellowship was to the value of £1,500 a year plus superannuation contributions and expenses.

The year before the Representative Body had approved the recommendations of the Interdepartmental Committee on Drug Addiction (Brain Committee). One of the recommendations had been that a number of special treatment centres should be set up, particularly in the London area. It had also been agreed that the prescribing of heroin and cocaine to addicts should be limited to doctors on the staff of those treatment centres. It had been made clear that the centres might be either governmental or privately run. Mr. Lawrence Abel said that there had been discussions in his committee about those patients who might have to remain indefinitely under the care of treatment centres, and it was thought that there should be proper facilities for long-term rehabilitation, both psychological and physical. These were essential if a relapse was to be avoided.

The motion was carried.

B.M.A. Lectures

Dr. R. W. BIAGI (West Denbigh and Flint) moved: "That the Association should consider the relationship between postgraduate centres, where these exist, and B.M.A. activities, particularly the function of the annual lecture in the Division. The scope of the lecture should be enlarged so that the visiting lecturer can participate in the activities of these centres at the time of the visit, by prior consultation where possible."

Dr. Biagi said that East Yorkshire had suggested that the political functions of the Association should be separated from the clinical and scientific functions. The separation was taking place, said Dr. Biagi. It was difficult to arrange a medico-political meeting in some parts of the country in B.M.A. offices, as so often these offices were now used by the postgraduate teaching units of medical institutions. The B.M.A. should increase its influence in the field of postgraduate education, and as a first move B.M.A. lecturers should lecture to postgraduate medical institutions.

The motion was carried.

First Aid

A motion standing in the name of Derby, "That this Meeting considers that the present manual of instruction issued to first aiders (paragraph 186) needs drastic alteration, and that Council be requested to make representations to the appropriate authorities," was carried.

Accident Prevention

A motion standing in the name of St. Marylebone, "That this Meeting recommends that much more effort be expended in ensuring that crash helmets are worn by motor cyclists, and in publicizing the advice of the Medical Commission on Accident Prevention of the Royal College of Physicians and Surgeons to this effect," was carried.

Commonwealth Corresponding Members

The following motion by the Chairman of the Committee on Medical Science, Education, and Research, "That the provisions of the by-laws relating to Honorary Members be extended to include 'Commonwealth Corresponding Members' elected by the Council on the nomination of the Committee on Medical Science, Education, and Research," was carried.

Drug Addiction

Mr. LAWRENCE ABEL (speaking as representative of the St. Marylebone Division) moved: "That this Meeting recommends that when a patient has completed treatment for drug addiction there should be adequate provision for his rehabilitation and follow-up on a long-term basis."

He said that information was available to show that many people who had been taken off drugs by doctors working in the various drug centres were thrown back into their old surroundings, and little rehabilitation work was being carried out. It took a minimum of six months and often twelve months or longer for the successful rehabilitation of a patient. The Brain Committee had strongly advised the Government in July 1965 that rehabilitation centres should be set up. This had not been done in the National Health Service or anywhere else, except two places, so far as he knew.

Dr. R. C. GREENBERG (Finchley) moved as an amendment: "To add the words 'such rehabilitation should be directed by persons with proper skills and experience in this field.'"

He pointed out that a great many people were jumping into this field who had no real practical knowledge of drug addiction There was a real danger that more harm than good would be done unless the work was directed and co-ordinated by experienced people.

The amendment was carried.

A further amendment was also accepted: "To add the words 'and that the Government be urged to implement all the other recommendations of the Brain Committee's report of 31 July 1965.'"

The motion as amended was carried.

Dr. R. MAGGS (Eastbourne) moved on behalf of North Devon: "That the prescribing, manufacturing, and import of amphetamine drugs be prohibited."

He said that the motion was the result of more than 30 years' experience of the drug by the profession and the public. Both medical and social problems originated from this drug. It could be said that as a result of medical practice the social problem was being unnecessarily complicated. Moreover, there was clear evidence that continued medical prescribing had been associated through the years with an ever-increasing incidence of side-effects which doctors now had to treat. "The position regarding amphetamines," Dr. Maggs asserted, "is, in my view, quite out of control both medically and socially."

"Soft" to "Hard"

Dr. P. H. CONNELL, of the Maudsley Hospital, said there was evidence that patients moved from taking "soft" drugs to taking "hard" drugs. That brought further medical problems. He stressed that the Dangerous Drugs Act was purposely not aimed at the amphetamine group of drugs. Dr. Connell also said that there was no possibility whatever of the treatment centres being adequately staffed in the near future. The profession had its time cut out dealing with the current problems, and clearly there was an urgent need for research. What could be done about the situation, asked Dr. Connell. The only approach the profession could take was to tell the country that doctors could no longer hold responsibility for these drugs until a treatment had been found for addiction.

Dr. W. A. H. STEVENSON (St. Marylebone) opposed the motion because it called for the abolition of the manufacture of the drug. He pointed out that it had a limited but definite use in psychiatry and also anaesthesia, which no other drug had been able to replace. He considered it a pity if doctors should refuse to take responsibility for a drug. If something was prohibited a black market trade usually sprang up and he therefore felt strongly that these drugs should be controlled.

Dr. C. P. WALLACE (Council) opposed the motion on the grounds that it represented a negative approach.

Asserting that the recommendation went too far, Dr. F. STEEL (Finchley) asked why not ban other products like alcohol, tobacco, and barbiturates. Suddenly something that had been prescribed for years had become a deadly dangerous drug. There was also the more evil aspect of the problem. If the motion was passed doctors would force the sale of amphetamine drugs underground into the hands of the drug pedlars, who would carry on a vicious black market.

Dr. MAGGS, in reply, said that during the discussion the value of amphetamine in anaesthetics had been mentioned. The fact was that there was no justification for the continuation of amphetamine as a drug. It produced ever-increasing side-effects for which there was no ready treatment.

Dr. RONALD GIBSON said he was a member of the Home Office Advisory Committee on drug addiction and it was aware of these motions. The committee had met last week, and, particularly in respect of amphetamine, it was awaiting the result of the Representative Body's deliberations.

The motion was lost.

Dr. A. M. MAIDEN thereupon took the chair.

The motion in the name of Tunbridge Wells, "That the Representative Body wishes to draw to the attention of all medical practitioners the dangers inherent in the use of the amphetamine group of drugs," was, by leave, withdrawn.

Amphetamines

Dr. W. A. H. STEVENSON (St. Marylebone) moved: "That this Meeting recommends that the manufacture, storage, and supply of the amphetamine group of drugs should be under much more adequate control —subject always, of course, to the right of a medically qualified practitioner to prescribe what he considers necessary for his patients."

Dr. DORIS M. ODLUM (Bournemouth) moved as an amendment: "To remove the words 'much more adequate control' and substitute 'under schedule 1.'"

Dr. Odlum said that as a psychiatrist she thought there was a place for amphetamine in limited circumstances, but that if it was placed under Schedule 1 it would prevent use of the drug being abused and at the same time retain its use for the occasions when there was no alternative.

The amendment was carried.

Later in the Meeting standing orders were suspended to allow further debate on the St. Marylebone motion as amended by Bournemouth.

Dr. R. C. GREENBERG (Finchley) moved as a further amendment: "To add the words 'and other drugs widely prescribed for slimming and barbiturates.'"

He said he did not think it was widely enough recognized by doctors and patients that addiction to drugs prescribed for slimming was very common.

This amendment was lost, and the motion, as amended by the first amendment, was passed without dissent.

Penalties for Peddling

Dr. P. J. BURROWS (South Bedfordshire) moved: "That this Meeting views with concern the increase in drug addiction, and recommends that the laws against drug peddling and the penalties for this crime be far more rigorously enforced."

He said that nearly every day the national press had a colourful story on the subject of drug addiction. All were concerned with the increasing use of drugs by young people. Whereas the Home Office knew the approximate number of people taking "hard" drugs the numbers taking amphetamines or "soft" drugs was not known. One of the dangers of taking "soft" drugs was that it brought the teenager into contact with the less savoury characters who peddled cocaine and heroin. Pedlars made fantastic profits and caused untold human suffering. They were also difficult to catch.

Mr. LAWRENCE ABEL said that he had been told that in the State of Ohio a drug pedlar got a minimum of 20 years and a maximum of 40 years in prison, and as a result drug addiction had virtually been stamped out in that State. If English law allowed such sentences to be passed on drug pedlars only two or three convictions would do a great deal to stop the menace.

The motion was carried without dissent.

Mr. LAWRENCE ABEL moved: "That the remainder of the Annual Report of Council under 'Medical Science, Education, and Research' be approved."

The motion was carried.

Other Motions on Medical Science

The motion in the name of Croydon, "That this Meeting urges Council to take whatever steps it considers necessary to publicize the 1965 British Standard Specification on thermometers agreed by representatives of the profession distinguishing the average 'normal' temperature at 98.6° F. (37° C.)," was carried as a reference to Council.

The following motion in the name of St. Marylebone, "That this Meeting wishes to reaffirm the decision of the A.R.M., 1961, which was finally stressed by the World Health Organization to ensure that patients are not used as experimental guinea-pigs without their full knowledge and consent. This consent should be given only in circumstances of complete freedom," was, by leave, withdrawn.

A motion in the name of Exeter, "That this Meeting feels it desirable when writing prescriptions for scheduled poisons to put the quantity prescribed in words to prevent subsequent unauthorized alteration," was carried as a reference to the Council.

A motion in the name of Medway and Gravesend, "That this A.R.M. instructs Council to press for the inclusion of postgraduate studies as part of the official field of medical education and that postgraduate centres, particularly those specializing in obstetrics, should be given official status and the finance needed to recruit the necessary staff and to maintain research and teaching facilities," was accepted without discussion.

"Family Doctor"

Dr. CATHERINE M. GRAY (Chairman of the Family Doctor Committee) moved: "That the Annual Report of Council under 'Family Doctor' (Doc. A.R.M. 2, paragraph 165) be received."

Dr. Gray paid tribute to the work of the late Dr. Harvey Flack, to whose skill as an editor and determination the Association owed its present position in the field of health education.

Family Doctor had run for almost 16 years, said Dr. Gray. For seven years, until 1966, Dr. Annis Gillie had been the very able chairman of the Family Doctor Committee. When *Family Doctor* had ceased publication in February 1967 the Council had decided that a full Committee was no longer necessary, but that it was essential that the "Family Doctor" project should continue. The Association must press forward in health education and "Family Doctor" publications must go on and expand. The Council had decided that it could best be carried out by a small managerial board of three members—the Chairman of Council, the Treasurer, and Dr. Gray herself. It had been considered adequate to appoint a part-time rather than a full-time editor. Dr. Gray was pleased to tell the Meeting that Dr. Trevor Weston had been appointed. Dr. Weston had received his medical education at St. Bartholomew's Hospital and was a Butterworth Gold Medallist in 1959. He had had considerable experience in both medical practice and medical journalism. Dr. Gray wished Dr. Weston every success in the future.

On the booklet "Health on Holiday," Dr. Gray said that unfortunately restrictions on holiday travel had delayed the decision to print, and subsequently technical difficulties had prevented publication in time for the holiday season.

The motion was carried.

"British Medical Journal"

Dr. J. G. M. HAMILTON (Chairman of the Journal Committee) moved: "That the Annual Report of Council under 'British Medical Journal' (Doc. A.R.M. 2, paragraph 164) be received."

Dr. Hamilton reminded the Meeting that in 1966 he had reported that arrangements were being made for the *B.M.J.* to be printed and distributed in Australia. This had started in January 1967. The enterprise was progressing, and it had enabled subscribers in Australia and New Zealand to see the *British Medical Journal* within a few days of its publication in London.

The *B.M.J.* and its associated specialist journals had shown without exception in the past 12 months an increase in circulation. They covered the whole world, and had a reputation that stood higher than ever.

Dr. Hamilton congratulated the Editor and his staff.

Selective Reporting

Dr. F. O. WELLS (East Suffolk) moved: "That this Meeting regrets that the reporting of the proceedings of Council and of the General Medical Services Committee in the *British Medical Journal* appears to be selective, and suggests that complete reporting of these proceedings should be undertaken either by the *British Medical Journal* or by an independent medical publication."

Dr. Wells said the motion was not in any way intended to censure the *British Medical Journal*. There had been occasions when the reporting of the proceedings of the Council and of the G.M.S. Committee had been misleading, as parts of the debates had been left unreported. He thought there should be available some complete record of the proceedings so that members who wished to read it could do so. How such reporting could be done was best left to the *Journal* department to decide. It should be done as cheaply as possible, or for a fee if necessary.

Dr. HAMILTON observed that by definition reporting was selective. The suggestion from East Suffolk that the *Journal* should publish verbatim reports could not be accepted. Such reporting would be "astronomically expensive" and would leave no editorial responsibility.

Dr. S. WAND said that in connexion with a later motion he would give figures of the cost of such an exercise which would surprise the Meeting. That had to be measured against the need of the Association to use its money to the best advantage.

Dr. WELLS, in reply, said that the motion by North Glamorgan and Brecknock under "Information Services" suggested a medical "Hansard." He reiterated what he had said in moving the motion: it should be done as cheaply as possible and for a fee if necessary. He proposed a reference to the Council so that it could report next year.

Dr. HAMILTON thought a reference to the Council would be a waste of time and money.

The motion was lost.

Information Services

The CHAIRMAN formally moved a motion by North Glamorgan and Brecknock: "That the B.M.A. should print, for sale to members of the profession if necessary, a 'Medical Hansard,' reporting verbatim the proceedings of Council, the G.M.S.C., and the C.C. and S.C."

Dr. Wand explained that this proposal had been costed. The figures showed that if a separate "Hansard" was produced it would cost at least £18,000 to £19,000 a year. The cost of reporting, transcribing, proof-reading, and so on for this type of production was fantastic. The cost of producing it in the *Journal,* because of the increased cost of paper, postage, and so on, would bring the figure up to about £46,000 a year.

Dr. E. V. Kuenssberg (City of Edinburgh) asked, "What do we want all this money spent for? For unproductive words, for paper? I thought the B.M.A. had a purpose, the purpose being the advancement of science and learning."

Dr. Outwin (Council) emphasized that the motion merely asked for a verbatim report of proceedings of the Council and various committees. That should not be difficult and he thought the publication expense need not be great.

Dr. Hamilton explained that the parliamentary *Hansard* had been taken as the standard when this proposal had been considered. There were approximately 18 G.M.S. Committee meetings, 11 Council meetings, and 7 C.C. and S. Committee meetings during the year. That meant 37,500 words per day to be recorded. That was a costly job. Dr. Outwin was misleading the Representative Body if he thought it could be done on the cheap.

The motion was lost by a large majority.

Dr. Hamilton moved: "That the remainder of the Annual Report of Council under 'British Medical Journal' be approved."

The motion was carried.

Tribute to Dr. Hamilton

The Chairman announced that Dr. Hamilton was not putting himself up for election again as chairman of the Journal Committee. He had held the position for many years.

Dr. Hamilton was accorded a standing ovation.

Medical Teachers and Research Workers

Professor I. Rannie (Newcastle upon Tyne), speaking in the absence of the Chairman of the Committee, Dr. K. S. Zinnemann) moved: "That the Annual Report of Council under 'Full-time Medical Teachers and Research Workers' (Doc. A.R.M. 2, paragraphs 123–127) be received."

He said that the Meeting had already heard from the Chairman of Council that the clinical teachers had received their increased remuneration in full at the end of the "freeze." The increase had not been phased. He emphasized that that was largely due to the energetic intervention of the B.M.A. deputation led by the Chairman of Council.

Professor Rannie said that in future, all university teachers were to have their remuneration referred to the Prices and Incomes Board. There would be a special panel of the board to consider the remuneration of medical teachers which would consult with the Review Body, but which might report at an entirely different time. That could lead to one section of the profession being out of step with other doctors as had happened recently.

There had still been no agreement with the University Grants Committee about special responsibility payments. There was a certain amount of semantic difficulty here. University medical teachers considered that the posts they held in themselves merited special responsibility payments. The U.G.C. said they were payments given for people who had posts of special responsibility. It really meant that university medical teachers did not get this payment until they had reached the top of their salary scale, and then it was given in increments.

Remuneration of Clinical Teachers

A motion by Newcastle upon Tyne, "That this Meeting wishes to thank Council for its continuing support given to the standing committee for Full-time Medical Teachers and Research Workers in this Committee's efforts to obtain appropriate and just levels of remuneration for medical clinical teachers who were caught in the prices and incomes freeze," was carried.

A motion by Newcastle upon Tyne, "That this Meeting requests Council to continue to press for the inclusion of medical clinical teachers in the remit of the Kindersley Review Body," was carried.

Professor Rannie (Newcastle upon Tyne) formally moved: "That the remainder of the Annual Report of Council under 'Full-time Medical Teachers and Research Workers' be approved."

The motion was carried.

Armed Forces

Major-General J. C. Barnetson (Chairman of the Armed Forces Committee) moved: "That the Annual Report of Council under 'Armed Forces' (Doc. A.R.M. 2, paras. 203–205) be received." This was agreed to.

Referring to the remuneration difficulties he said that by applying sanctions and blackballing recruitment into the medical Services the Council had done all that it could do.

His second point was that, subsequent to the Annual Report of Council going to press, a working party had been set up, comprising Air Marshal Sir Richard Nelson, D.G.M.S., Royal Air Force, Surgeon Commander B. C. Morson, Royal Naval Volunteer Reserve, Mr. R. Myles Gibson, and himself, to look into pay and terms of doctors in the armed Forces so that they could have recommendations ready when negotiations were reopened. He thanked the Secretary of the Armed Forces Committee, Dr. Gordon Macpherson, for all the hard work he had put in.

Pay Review

A motion by Portsmouth, "That this Meeting deplores the failure to secure proportionate salary increases for Service medical officers and strongly supports Council's action in dissuading doctors from entering this service," was carried.

A motion by Buckinghamshire, "That this Meeting endorses Council's actions concerning Service doctors, but suggests a full review of their terms of service, including remuneration, in readiness for resumption of negotiations," was, by leave, withdrawn.

Constitution of Committee

Major-General Barnetson moved: "That the constitution of the Armed Forces Committee be amended so that the co-option of six members as at present be replaced by the co-option of nine members on the following basis: the Deputy Director General of the Medical Branch of each of the three Services; two representatives of the rank of major/lieutenant commander/squadron leader or below, one of whom should preferably be of specialist status, from the medical branch of each of the Services."

The motion was carried.

Dr. A. N. Mathias resumed the chair.

A motion by the Chairman of the Armed Forces Committee: "That the remainder of the Annual Report of Council under 'Armed Forces' be approved," was carried.

Hospital and Consultant Services

Mr. H. H. Langston (Chairman) moved: "That the Annual Report of Council under 'Hospital and Consultant Services' (Doc. A.R.M. 2, paras. 70–97), Memorandum on Current Problems of Hospital Medical Staff (Appendix III), and Report on Postgraduate Training (Appendix IV) be received."

He said that the Central Consultants and Specialists Committee had never experienced a busier, more momentous, or more stormy year. It was particularly unfortunate that the circumstances and the enormous Agenda of the Meeting had prevented discussion on so many matters. Mr. Langston expressed his thanks to those who had agreed to motions being treated as references to the Council. Those motions would receive the fullest consideration.

He believed that during the year the Committee had reached its full stature, and that its change of name was particularly appropriate. Not only had the Committee's constitution been substantially modified but its responsibility had been fully recognized. The Royal Colleges had accorded it full responsibility for negotiating on terms and conditions of service and for preparing and submitting evidence to the Review Body on remuneration. The Joint Consultants Committee would concern itself primarily with academic standards, teaching, research, and matters such as private practice, but both the C.C. and S. Committee and the Joint Consultants Committee were represented on the new negotiating committee, because terms and conditions of service had inevitably to be related to standards and matters of academic teaching.

The negotiating committee would be directly responsible to the new Central Committee for Hospital Medical Services. Their dental colleagues were also represented on the negotiating committee. Mr. Langston thought it could be said that not only was unity fully preserved but that the new Committee would be fully representative and had full authority to speak for all those who worked in the hospital service. He referred to the Committee's publication known as the "Hospital Charter." It had formed the basis of negotiations with the Ministry during the last six months.

The items discussed and brought to a conclusion with the Ministry, and about which circulars had been issued, were time off duty for hospital junior staff; study leave; sick leave; grants for removal expenses; telephone expenses; rents for married accommodation; locum services. New concessions had been obtained in all these items. The first two were the most important, and for the first time it had been recognized that a hospital junior doctor was entitled to a minimum amount of time off duty and that a doctor in the junior grades was in training, and therefore entitled to a minimum amount of time off for study during the year.

Mr. Langston said that discussions still continued on a number of items. One of those items concerned excessive work load and its identification. He believed that ultimately a satisfactory conclusion would be reached, though in part it was a matter for the Review Body, because it involved extra remuneration.

The most important discussion going on was one that would take a little time, and that was on career structure. It had to be ensured that a young man at the end of his senior house-officer training who wished to make a career in hospital medicine or wanted to have extra training for general practice should be able to get advice. Even more important, he should with the aid of a postgraduate course be able to plan a career, stage by stage, from the time he decided to take up medicine. This had never been possible before. The lack of a career structure was one of the major causes of dissatisfaction with which they had had to deal during the last year.

Negotiating Committee

Dr. T. D. CULBERT (Manchester) moved: "That this Annual Representative Meeting does not approve of the action already taken by the Central Consultants and Specialists Committee in reducing from four to three the numbers of the hospital junior staff representatives who sit on the negotiating committee for all hospital medical staff, which has 15 seats, and asks the C.C. and S. Committee to reconsider this matter in the light of the recommendations initially made by the Joint Consultants Committee."

It was very important that the Representative Body should support the motion, Dr. Culbert said. On the "committee of nine" which had been negotiating for hospital staffs with the Ministry there had been four junior representatives. The Joint Consultants Committee had recommended that on the permanent negotiating committee of 15 there should still be four hospital junior staff representatives. The C.C. and S. Committee, however, after discussion, had decided that junior staff representation should be "not less than three," which seemed to open the door to four. The negotiating committee would be up for re-election in October, and Dr. Culbert said that he wanted the Representative Body to see that the original recommendation of the Joint Consultants Committee should be accepted by the Central Committee for Hospital Medical Services (as the C.C. and S. Committee was now named) in the interests of the whole profession.

Dr. B. LIVESLEY (Manchester) wholeheartedly supported the motion as being one vital to the future interests of all hospital staff. He asked the Representative Body to give unanimous support to the motion, not only because of its importance but also to demonstrate unequivocally to all hospital junior staff that action could be taken on their behalf without recourse to a non-B.M.A. association.

Dr. E. A. HARVEY-SMITH (Chairman, Hospital Junior Staffs Group) supported the motion. Dr. J. S. ROSS (Council) said the impression that had been created by reducing the figure from four to three was not a good one among the young doctors. It had to be put right.

Mr. LANGSTON reminded the Meeting that the constitution of the new negotiating committee provided for "not less than three" junior members, which still allowed for another junior being elected into one of the other seats. The present constitution of the committee was provisional and would be reviewed in October.

The motion was carried.

Review Body

The CHAIRMAN moved formally the following motion by Morpeth and Blyth, which was accepted: "That this Meeting instructs Council (*a*) to strive for the abolition of meal charges for hospital medical staff necessarily eating in hospital; (*b*) that hospital medical staff should have their own dining-room."

Mr. H. H. LANGSTON said that this was the Committee's policy. The first part of the motion was a Review Body matter, and it would be pressed very strongly. He understood that the Ministry had advised regional boards to partition off sections of dining-rooms in new hospitals. It was not what had been asked for, but it was something.

The motion was carried.

Current Problems

A motion standing in the name of Southampton, "That with reference to Appendix II of the Annual Report of Council this Representative Meeting congratulates the Central Consultants and Specialists Committee on the clarity and vigour of the memorandum, and urges Council to press for the proposals made with unexampled vigour. Special attention should be given to realistic allowances," was accepted.

Dr. J. C. BROCKLEHURST (Bromley) moved: "That this Meeting welcomes the first joint report of the negotiations with N.H.S. doctors and dentists, which contains many important points. Even, however, on those points where agreement has been reached with the Ministry of Health they regard it as doubtful whether these can be implemented in some areas as certainly they cannot be unless additional finance is provided for the hospitals."

Dr. Brocklehurst said his Division welcomed the "Hospital Charter" and the terms in which it set out important developments, but there seemed no possibility of implementing the changes already agreed with the Minister unless considerably more money became available.

An amendment "to insert the words 'and personnel are' after the word 'finance'" was agreed.

Dr. CULBERT supported the motion because it drew attention to the fact that the whole of the National Health Service was starved of money. Dr. J. R. BENNETT (Council) asked the Representative Body to vote against the motion, not because more staff and money were not needed but because it was saying that the profession might as well not have gone to the Ministry of Health to try to improve the lot of hospital junior staff by obtaining agreements for study leave and so on.

Mr. LANGSTON said it was recognized on both sides that the immediate requirements would be difficult to achieve. It was something the profession had to give thought to.

Dr. BROCKLEHURST, in reply, said hospital medical staff committees had for many years been looking into the matter. It was a vicious circle: both money and manpower were needed.

The motion was carried.

Dr. K. W. BEETHAM (East Yorkshire) moved: "That, with reference to paragraph 75 of the Annual Report of Council, this Representative Body regrets that no opportunity was given to Divisions to discuss the contents of the Hospital Charter before this was submitted to the Minister, and resolves that in future no exercises of this type for any branch of the profession shall be conducted without formal opportunity for discussions in Divisions."

It had been said many times that hospital staffs were inadequately represented. "It seems fantastic when the Hospital Charter was drawn up that it was not sent to Divisions for adequate discussion," said Dr. Beetham. When any negotiations were contemplated involving any section of the profession, those matters should first be discussed at Divisional level.

Mr. LANGSTON said he hoped the Representative Body would reject the motion. The C.C. and S. Committee had had to produce the "charter" as a matter of great urgency. It had involved a great deal of work. The document had been published and acted upon on the express wish of the Council. It had been unanimously supported by all the members of Council, including the representative of East Yorkshire.

Dr. BEETHAM, in reply, said that the motion asked that in future matters that involved a large body of the profession should be discussed at Divisional level. If terms and conditions of service were to be negotiated with the Minister it was surely obvious that those concerned should have a chance to discuss them and to put forward their views.

The motion was carried.

Hospital Junior Staff

Dr. E. A. HARVEY-SMITH (Chairman of the Hospital Junior Staffs Group Council) moved: "That this Meeting earnestly desires a considerable improvement in the terms, conditions, and prospects of all hospital junior staffs, and pledges the full resources of the

Association to that end. In view of the obviously common aim of achieving such improvement it regrets, however, the wasteful division of the efforts of junior staff produced by the duplication of bodies representing this single group of the profession."

He said that there was no doubt that hospital junior staff must have one body that not only represented them but was seen by the periphery to represent them. That body, in his view, must be within the Association and the sooner all junior staff supported it the better, for their own sake. He did not wish to prejudge discussion on the suggestion of a third autonomous stream for hospital junior staff, but that could be seen only in terms of an autonomous standing committee, equivalent in stature and status to the General Medical Services Committee and the Central Consultants and Specialists Committee.

If it was decided that this was the right course, Dr. HARVEY-SMITH asked what would happen to the hospital junior staffs' representation. At present the whole executive committee, 12 members, were on the C.C. and S. Committee. Could junior staff expect any special privileged position on other standing committees if they became a standing committee? It could be that they would lose their 12 seats, as of right, and be reduced to one seat for an observer seat. That would effectively rule them out of a lot of discussion on the C.C. and S. Committee, said Dr. Harvey-Smith. The two important points were, he said, the status of the Hospital Junior Staffs Group in the eyes of the periphery and co-operation and agreement with the consultants in the matter of negotiations. They must go forward together.

The CHAIRMAN formally moved as an amendment: "To delete all words in the motion after the word 'end' in line 4."

Dr. J. R. BENNETT (Council) opposed the amendment. The whole purpose of the motion was served by the second sentence. Already two hours of the Representative Body's time had been wasted because of the duplication of these bodies.

The amendment was lost.

Association's Support

Dr. D. GUTTMAN (Council) said that he wanted to draw the attention of the Representative Body to that part of the motion which pledged the full support of the Association in obtaining improvements in the terms, conditions, and prospects of hospital junior staffs. "In pledging the full resources of the Association for the hospital junior staff, I would ask members of the Representative Body what they themselves can do when they get back to their Divisions to interest the hospital junior staff in their local hospitals and in the affairs of the Association, and in particular to become politically conscious in order to participate in their regional hospital junior staff groups. I would ask the co-operation of the Representative Body in this," said Dr. Guttman.

Mr. LANGSTON said he warmly supported the motion, and he hoped the Meeting would pass it.

Dr. HARVEY-SMITH said he would pledge himself, his executive, and, he was sure, the whole hospital junior staffs group, to see that during the coming year every member of the hospital junior doctors was satisfied.

The motion was carried.

The following motion by Brighton and Mid-Sussex was approved as a reference to Council: "That in view of the unsatisfactory career structure of hospital junior staff, it is proposed that in future 75% of the appointments to the ranks of registrar and senior registrar should be linked to major centres."

The following motion from Mid-Essex was also referred to Council: "That the consultant selection committees should be balanced in order to ensure that the application of the registrar with regional experience is always considered equitably."

Needs of Regional Hospitals

Mr. D. B. BROWN (Mid-Essex) moved: "That there should be proportional representation of regional and teaching hospital consultants on each joint advisory committee for senior registrars."

He said that recently 968 junior doctors had answered a questionary concerning their career intentions. Not only because of pay and terms of service but because of dissatisfaction with postgraduate and vocational training facilities 50% had said they intended to emigrate. Mr. Brown said that of the junior staff who stayed in hospital and wished to become specialists virtually all found that they must work in designated teaching hospitals as senior registrars if they wished to succeed. "May I remind you that, this being the case, most of these young people therefore gravitate to these hospitals as house-surgeons and registrars so as to be known when the senior registrar posts become vacant." So it is we have a situation where these designated teaching hospitals are overstaffed and yet the regional board hospitals serving 80 to 90% of the National Health Service needs of this country are understaffed. Mr. Brown said there were reasons why the present position should not be perpetuated. (1) Many of the large regional hospitals were the postgraduate teaching hospitals of today. (2) They provided enormous clinical and operative experience and so gave better practical training to junior doctors. (3) More consultants were needed and therefore more senior registrars in training were urgently required. (4) As each regional hospital was so poorly staffed compared with the undergraduate teaching hospitals this looked like a Ministry acceptance of two standards of doctor–nurse care of National Health Service patients.

If there were opportunities for a career in regional board hospitals as well as in the large teaching hospitals it would immediately attract many more graduates to them as house-surgeons, senior registrars, and consultants, which would result in those hospitals being more adequately staffed, helping the Exchequer and taxpayer by reducing emigration, and giving the patients a better service.

Mr. LANGSTON said this problem needed examining, and, though he was not entirely happy with the wording of the motion, he was prepared to accept it as a reference to the Council.

The motion was passed as a reference to the Council.

Dr. I. McD. G. STEWART (Blackpool and Fylde) moved: "That Council should concern itself less with the sectional interests of junior hospital staff, but more with the career prospects of the consultant staff."

He said that only about 10% of hospital junior staff intended staying on in the hospital service. But that had not prevented hospital junior doctors from giving a lot of advice. Much of it was inappropriate for patients and for staff, as everyone who worked in a hospital knew. What was the reason for playing to the public ear to such an extent? Was it scarcity value, and because the Government had shown itself willing to offer short-term bribes to this group of workers in the hospital service? The B.M.A. should be wary of ignoring the large body of B.M.A. opinion, which was hardly ever represented, and should refer to the thousands of relatively silent, middle-aged consultants.

Dr. K. W. BEETHAM (East Yorkshire) moved as an amendment, "That Council should concern itself not only with the sectional interests of the junior hospital staff but also with the career prospects of the consultant staff."

He said that the point of the amendment was that it would be undesirable to instruct the Council to become less concerned with the interests of any section of the profession. The Council could, however, show some evidence that it was also interested and concerned about established consultants. That might be the reason why consultants had done relatively badly in recent awards. The consultant was a docile animal, partly because he was established and middle-aged, and maybe he suffered under the secret merit award system. But the fact was that differentials within the consultant body were quite fantastic, the remuneration varied between £3,000 and £10,000, and in addition there was private practice. There were a number of consultants who were becoming concerned about the position, but until, like the hospital junior staff, they made a noise on T.V. and in the newspapers, little notice would be taken of their legitimate grievances.

Mr. LANGSTON accepted the amendment proposed by East Yorkshire.

The amendment was carried as the substantive motion.

Review of Medical Staffing

A motion by Cleveland and Middlesbrough, "That this Representative Body demands that the figures arising from the review of hospital medical staffing is modified, and brought up to date following the Platt Committee Report, should be published," was referred to Council.

Staffing of Accident and Emergency Departments

Dr. A. K. THOULD (Cornwall) said that it was proposed to take a block of motions under this section of the Agenda and refer them to the Council. That was just the sort of thing that many doctors would like to bring to the attention of the Representative Body. These motions were to be passed to the Council without anyone having the opportunity to discuss them. It was for this reason that he begged to dissent.

A motion concerning the staffing of accident and emergency departments from Southampton was accepted as a reference to Council.

Hospital Building Programme

Motions from St. Marylebone and Huddersfield Divisions concerning hospital building were passed as references to the Council.

Postgraduate Training

Mr. D. N. **Menzies** (Liverpool) moved: "That the authorities responsible for setting up committees to control postgraduate training at national and regional levels should be pressed to include a nominee of the Association on each committee."

He said that the B.M.A. was not represented on the central committee for medical education. There was ample reason for the Association to concern itself with postgraduate education. As the Association represented the whole profession it could look upon itself as co-ordinator for the whole profession.

Dr. J. R. **Bennett** (Council) said the Chairman of Council had endeavoured to have the Association represented on this body, but so far unsuccessfully.

Dr. I. Mc. D. G. **Stewart** (Blackpool and Fylde), supported the motion, and Mr. **Langston** hoped the Meeting would strongly support it. His only reservation was that he would have preferred the word in the last sentence to be "nominees" instead of "nominee."

The motion was carried.

Motions Referred

A number of motions dealing with postgraduate training; allocation of distinction awards; medical assistants; care of the young chronic sick; hospital inpatient facilities for juvenile psychiatric patients; hospital medical staff conferences; increased medical student intake; open access to hospital diagnostic departments; physiotherapy; and geriatric hospital beds were accepted as references to the Council.

Disturbed Geriatric Patients

Dr. R. C. **Greenberg** (Finchley) moved: "That this Meeting deplores the lack of facilities for the care of disturbed geriatric patients, and urges the appointment, on an area basis, of a senior doctor from either the hospital or the local authority service who has responsibilitiy for the co-ordination of services for these patients. It requests that representations be made to the Government to provide urgent financial assistance for adequate hospital and local authority care and accommodation, both day and residential."

He said that in his borough of 318,000 people there were 40,000 people over the age of 65. He would expect roughly 2,500 seriously mentally deteriorated, 2,500 mildly mentally deteriorated, and 3,600 severely neurotic old people among them, quite apart from those old people suffering from affective disorders amenable to treatment. Such a problem could never be solved in terms of institutional beds alone. Well over half the mental illness of old age could now be efficiently treated and the patients returned to their homes fit and well. Of the remainder, much could be done by kind, sympathetic, and informed management. This problem required a comprehensive programme involving a wide range of services including day centres, hostels, and supporting services. Dr. Greenberg concluded: "This is a problem that must be taken seriously and must have adequate financial provision and humane and imaginative planning."

The **Chairman** said there was an amendment to add the words "and in the light of recent publicity about alleged cruelty to patients, this Meeting affirms its admiration for and confidence in the nursing profession of this country, who often have to provide nursing care in adverse working conditions."

Mr. **Langston** said he was sure the Representative Body would accept the motion and the amendment.

A motion that the question be now put was carried by the necessary majority.

Dr. **Greenberg** said, in reply, that he had the greatest sympathy with the amendment.

The motion as amended was carried.

Other Motions

A motion standing in the name of Havering, "That this Meeting recommends the use of a standard discharge summary form giving details of the diagnosis, treatment, and follow-up recommendations," was carried as a reference to Council.

The following motion, standing in the name of Waltham Forest, was, by leave, withdrawn: "That, with reference to paragraph 96 of the Annual Report of Council, this Meeting would be grateful to be informed of the Minister of Health's reply to Council representation on this matter."

The following motion by Worcester and Bromsgrove was formally moved and carried without dissent:

"That this Representative Body urges the Ministry of Health and its regional hospital boards to take note of proposals in certain areas to increase population densities, by redistribution, redevelopment, or formation of new towns, and to provide in good time appropriate hospital services for these areas."

Remainder of Report

Mr. **Langston** moved: "That the remainder of the Annual Report of Council under Hospital and Consultant Services be approved."

He thanked the Secretary of the C.C. & S. Committee, Dr. E. Grey-Turner, and others of the staff who had done "a monumental amount of work for the Committee, often working at weekends."

Regret at Short Discussion

Dr. B. **Livesley** (Manchester) formally moved as an amendment: "The addition of the words 'and noting that it is the aim of the Representative Body to represent all sections of the profession, this Meeting regrets the short time available for discussion of hospital affairs.'"

Dr. G. E. **Crawford** (Liverpool) supported the amendment. He told colleagues: "Go to the B.M.A. and let your voices be heard." If such a short time were allotted to the hospital services in debates in the Representative Body more support than ever would be lost.

Dr. A. K. **Thould** (Cornwall) said: "We have seen this afternoon the farcical situation of the rubber-stamping of an entire and important section of motions." There were many matters that representatives would have liked to have discussed in full and to have obtained the views of the Representative Body. But this had not been possible, which was a matter of considerable regret.

Dr. J. S. **Ross** (Council) believed that as a result of the acceptance of the Constitution Committee's proposals such a situation would never arise again. For a whole day matters that had been discussed a fortnight before in the Conference of Representatives of Local Medical Committees had been rediscussed.

Dr. J. C. **Cameron** (Chairman of the G.M.S. Committee) added his regrets. In defence of his Committee he said that he had hurried its business as much as possible.

The amendment was carried.

The motion as amended was carried.

Fee for Cremation Certificates

A motion standing in the name of Liverpool, "That completion of cremation certificates parts B and C attract a fee for all doctors," was carried as a reference to Council.

Domiciliary Consultations

Dr. E. C. G. **Rhind** (Sheffield) moved: "That in the case of whole-time consultants and S.H.M.O.s full fees be paid for the first 42 domiciliary consultations in a quarter."

He pointed out that after 19 years of the National Health Service, despite support from the A.R.M. and the C.C. and S. Committee for the abolition of the eight free domiciliary consultations imposed on whole-time consultants and S.H.M.O.s, the rule still remained in force. This meant that many consultants who performed only a small number of consultations received no extra fees or only a small sum for extra services provided. The ruling applied to the first eight domiciliary consultations carried out in a quarter. A review conducted in 1964 showed that the average number of consultations was 14 and that one-third of all visits did not qualify for payment. "This is one of the best bargains the Ministry has in the Health Service and the highest level of slavery in the hospital service," Dr. Rhind maintained. The Review Body had repeatedly rejected the proposal for the abolition of the eight free consultations and therefore, said Dr. Rhind, Sheffield's motion seemed the best alternative.

Dr. R. A. A. R. **Lawrence** (Derby) moved as an amendment: "That, in the case of whole-time consultants and S.H.M.O.s, all domiciliary consultations should be paid for."

He said that the motion was merely an ingenious attempt to make an injustice tolerable. It did not remove the injustice. By making a ceiling of 200 per annum, which was the policy of the Association, the implication was that some consultants might do too many, which was a distasteful implication.

Mr. W. DRUMMOND (Fife), speaking as a whole-time consultant, opposed the amendment. If implemented it would in theory give whole-timers access to unlimited consultations and unlimited fees, but in point of fact it had been the policy of the C.C. and S. Committee and of the Association to limit the fees to 200 consultations in a year. The amendment cut right across this.

Mr. LANGSTON said he could not accept the amendment. To exceed the ceiling would mean that a consultant would have difficulty in doing his hospital work, as he would be out all the time.

Dr. LAWRENCE repeated that the implication that some full-timers would deliberately go out to do an excessive number of domiciliary visits was distasteful.

The amendment was lost.

Dr. I. McD. G. STEWART (Blackpool and Fylde) opposed the motion, which was a plain invitation to a whole-time service. A man should decide whether he wanted to do whole-time or part-time service and not try to get the best of both worlds.

Mr. LANGSTON said he would accept the motion as a reference to the Council.

The motion was carried as a reference to the Council.

Mileage Allowances

A motion standing in the name of Sheffield, "That this Meeting supports Council in its current negotiations on car mileage allowances in the hospital service," was carried.

Telephone Expenses

A motion standing in the name of Sheffield, "That this Meeting instructs Council to re-examine the question of telephone expenses for all grades of hospital medical staff," was carried.

Consultants and G.P. Units

A motion standing in the name of Dunbartonshire, "That there should be an investigation into a proper method of recognition for the services of a consultant who undertakes work in a general-practitioner unit," was carried as a reference to the Council.

Nursing Staff

Dr. E. H. J. COTTER (East Herts) moved: "That this Meeting deplores the 10% cut in nursing staff imposed by many regional hospital boards. This is disastrous to the morale of the nurses and to the efficiency of the hospital service."

He pointed out that this was not the first cut in the last five years. Taking five years ago as 100%, there had been a 12% cut previously, so this was now a 10% cut on 88%. Regional hospital board hospitals survived with staffs down to 60%, owing to the heroic efforts of the remaining staff. The Representative Body must show its appreciation of the nursing staff's efforts.

Dr. J. C. BROCKLEHURST (Bromley) said that as a result of the recent further arbitrary reduction in a number of hospitals nurses would be lost. In peripheral hospitals nurses were doing far too much work. Wards were sometimes left during the night in the care of nursing auxiliaries.

Mr. LANGSTON pointed out that every new hospital which opened meant more nurses were wanted. The increase in the number of nurses was not keeping pace with the increase in the number of hospitals, or with techniques which required a specially trained nursing staff. An intensive care unit immediately meant more nurses were required. Many regional boards had had to peg their establishments at a figure they regarded as below that desired, said Mr. Langston.

The motion was carried.

Pre-registration Posts

A motion standing in the name of Birmingham, "That this Meeting is of the opinion that any provisionally registered practitioner shall be allowed to take his pre-registration posts in any hospital approved for the purpose, regardless of its geographical location," was carried as a reference to Council.

Drug Addiction

Dr. DORIS M. ODLUM (Bournemouth) referred to the amended resolution, standing in the name of St. Marylebone, which had been passed earlier with regard to the manufacture, storage, and supply of amphetamines. Since then, she and Mr. Abel, the Chairman of the Medical Science, Education, and Research Committee, had talked with the Association of the British Pharmaceutical Industry. They had been advised that the form in which the resolution was passed, that the amphetamines should be put under Schedule 1, would not be helpful, and might even weaken the present position. She asked that the original motion be substituted which would leave the matter open for discussion by the Science Committee, which could report back.

A motion to suspend Standing Orders was carried by the necessary majority.

Dr. DORIS M. ODLUM moved, "That this Meeting recommends that the manufacture, storage, and supply of the amphetamine group of drugs should be under much more adequate control—subject always, of course, to the right of a medically qualified practitioner to prescribe what he considered necessary for his patients."

The motion was carried.

Standing Orders were restored.

Medical Ethics

Dr. S. NOY SCOTT (Chairman of the Central Ethical Committee) moved: "That the Annual Report of Council under 'Medical Ethics' (Doc. A.R.M. 2, paras. 128–136) be received."

He said that it was an understatement to say that the year had not been exactly without incident. In most of what the Committee had done it had tried to be "with it" without upsetting the traditional standards of the profession.

The report was received.

Sharing of Premises

A motion standing in the name of Liverpool, "That this Meeting rejects Advice 1 of paragraph 128 of the Annual Report of Council with regard to the above, and recommends that waiting-rooms should not be shared," was carried as a reference to the Council.

Professional Secrecy

The following motion standing in the name of Rugby was carried as a reference to the Council: "That policy re professional secrecy be rephrased thus: 'It is every practitioner's duty to observe the rule of professional secrecy by refraining from disclosing voluntarily, without the specific written consent of the patient (or his legal guardian), to any third party information which he has learnt in his professional relationship with the patient; and this duty remains even after the death of the patient.' The only exceptions to this rule shall be (*a*) on statutory compulsion, (*b*) for cancer registration (or other research project specifically approved for this purpose by the Association), (*c*) if maintaining secrecy would be gravely detrimental to the interests of the patient."

Disclosure of Specialists' Reports to Life Offices

Dr. D. S. PIPER (Enfield and Potters Bar) moved: "That paragraph 130 of the Annual Report of Council be referred back to the Council."

He said that paragraph 130 dealt with disclosure of specialists' and hospital reports to life offices. It stated that the Council took the view that if a life office wished to see a specialist's report it should make a direct approach to the specialist concerned. The Council considered it undesirable for the complete case notes held either by a hospital or by a general practitioner to be given to a life assurance company even with the consent of the patient. Such notes might be out of date by the time the company received them and, furthermore, case notes often included letters which had passed between general practitioners, specialists, and other specialists. The patient could not effectively consent to the disclosure of such correspondence without the additional consent of the doctors concerned.

His Division had agreed that it was undesirable for life offices to be sent notes and letters about the case concerned. A lot of this information could safely be left to the discretion of the general practitioner to disclose if it was to the patient's advantage for him to do so. This was not unethical, and might lead to the patient obtaining advantageous terms. If paragraph 130 was agreed no pathological or *x*-ray reports could be sent in full to the life offices without the specialist concerned first being consulted and, incidentally, rewarded. If the Council was trying to obtain a fee for the consultants it should say so.

Dr. W. WOOLLEY (Bristol) said that the insurance companies could get all the information they needed in other ways. Old records might be quoted from, but there was no need at all to show the original documents, which had been sent to doctors for an entirely different purpose. Dr. Woolley urged the Meeting to reject the motion.

Dr. J. G. M. HAMILTON (City of Edinburgh) supported the motion. It was the only practical proposition to overturn the recommendation of the Ethical Committee. The proposer's consent to the disclosure of his medical history was always obtained. Dr. Hamilton said that he was very much against hospital case records being sent to anyone but the patient's family doctor. The opinion of a consultant was necessary for the decision of a life office and it might be necessary urgently in order for the patient to obtain insurance for himself. Urgency was often of paramount importance, since the insurance might be required for the cover of a house purchase loan.

Mr. LANGSTON urged the Meeting to reject the motion. Letters sent to a general practitioner by a consultant giving him clinical information about his patient would contain opinions that he was sure the consultant would not wish to be used for other purposes. Mr. Langston had no objection to a general practitioner extracting whatever information he thought appropriate, and making a report.

Dr. NOY SCOTT appealed to the Meeting to reject the motion.

Dr. PIPER, in reply, thought the matter could be left to the discretion of the general practitioners. It might well be to the patient's advantage as well as to his disadvantage, and in his view it had nothing to do with medical ethics.

The motion was lost.

Reference of Patients to Specialists

Dr. NOY SCOTT moved:

"That the amendment approved in 1963 to the 1957 statement on the acceptance of patients be reworded as follows:

"'A practitioner, in whatever form of practice, should take positive steps to satisfy himself that a patient who applies for treatment or advice is not already under the active* care of another practitioner before he accepts him.

"'If he is so satisfied he may accept him as his patient, but his acceptance should be subject to the considerations set out below.

"'A practitioner in any form of specialist practice should not, except in circumstances stated below, accept a patient for examination and advice except on a reference from a general practitioner. If a specialist decides that it would be more appropriate for a patient to be examined not by himself but by a specialist in a different field of practice, the patient should be referred back to the general practitioner.

"'The specialist should ensure that the true position is ascertained at the time an appointment is booked and should ask that an introductory letter be brought.

Exceptions

(a) Emergencies.

(b) Where previous inquiry indicates that the consultation is for refraction examination only.

(c) Where the specialist to whom a patient is referred wishes, as part of his management of the case, to obtain either a confirmatory opinion from another specialist or specialist opinion on a different aspect of the case—e.g., the advice of a radiologist or cardiologist.

(d) Consultations in venereology, either at clinics or in private.

(e) Overseas visitors having no family doctor in the United Kingdom.

(f) Where the delay in reference back to the general practitioner would seriously inconvenience the patient and provided that in such a case the specialist informs the general practitioner at the earliest opportunity of the action he has taken and the reason for it.

"'After the consultation, where further medical care is indicated, and especially where such care is within the province of the general practitioner, the specialist should do all he can to persuade the patient to be referred to a general practitioner to whom a report and advice should be sent in the same way as if the consultation had arisen from a normal reference.

"'A general practitioner receiving such a report should be prepared to accept that the specialist is making a genuine attempt to establish a correct relationship between the patient and his doctor.'"

Dr. F. O. WELLS (East Suffolk) moved an amendment, "That in paragraph (f) there be substituted for the words 'would seriously inconvenience' the words 'would be seriously detrimental to.'"

Dr. Wells wondered if a consultant who discovered a hernia, and this did not concern his specialty, would be able to refer the patient to another consultant without reference back to the general practitioner, just because it would be convenient for the patient. Surely the patient should be referred back to his general practitioner unless the hernia was seriously detrimental to the patient's health?

Dr. NOY SCOTT said that if the condition was detrimental to the patient's health that would come under the "urgent" rule and would be dealt with accordingly. The consultant might be 40, 50, or even 70 miles away, and it would be very inconvenient to go 70 miles and back. That was the only reason that provision had been made under the urgency rule.

Dr. WELLS said he represented a rural area. He felt that a patient would be prepared to go 30 miles there and back if his general practitioner wanted him to see a particular consultant.

The amendment was carried.

The motion as amended was carried.

Dr. A. M. MAIDEN took the chair.

A motion by Birmingham, "That this Meeting agrees that when a gynaecologist considers that a patient, as part of her treatment, requires contraceptive advice, and he has not been asked by her general practitioner to carry this out, he should, except in special circumstances, refer the patient back to her own doctor and not to a family planning clinic, and should, in any case, inform the general practitioner of his action in this matter," was accepted.

Family Planning

The following motion by Liverpool was accepted as a reference to the Council: "That, while endorsing the seven subsections of para. 135 of the Annual Report of Council, this Meeting proposes the following addition: 'When practitioners acting as individuals, or collectively, prescribe an oral or an intrauterine contraceptive they shall remain, in that respect, responsible for the future management of the patient. This shall in no way alter the normal relationship between a general practitioner and a consultant.'"

Dr. NOY SCOTT moved: "That the remainder of the Annual Report of Council under 'Medical Ethics' be approved."

In doing so, he paid tribute to the services of Dr. J. D. J. Havard as secretary of the Central Ethical Committee.

The motion was carried.

Duties and Powers of Central Ethical Committee

A motion by Enfield and Potters Bar, "That this Meeting instructs Council to re-examine the articles, by-laws, and standing orders relating to the duties and powers of the Central Ethical Committee, and to report to the next Annual Meeting of the Representative Body," was carried as a reference to the Council.

Also referred to the Council was a motion by Dartford: "That the resolution of the Central Ethical Committee of the B.M.A., as adopted by the Association in 1959, which reads as follows: 'That there is no ethical objection to the current practice of stating the address, name, and qualifications on letter headings, provided that the qualifications are not displayed for the purpose of calling attention to the imposing collection of degrees,' should have added the words, 'and providing they are genuine professional achievements.'"

This concluded the business of the Central Ethical Committee, and the Meeting accorded Dr. Noy Scott a standing ovation.

Dr. A. N. MATHIAS resumed the chair.

Charities

Dr. R. COVE-SMITH (Chairman of the Charities Committee) moved: "That the Annual Report of Council under 'Charities' (Doc. A.R.M. 2, paras. 260–261) be received."

Dr. Cove-Smith spoke of the need to maintain a regular inflow of funds, particularly by means of seven-year covenants. He said that last year there had been only 42 new covenants, bringing in £2,482. He felt the number ought to be much higher. He asked representatives to give strong support to the Charities Trust Fund.

The motion was carried.

Dr. A. E. LODEN (Tunbridge Wells) moved: "That in view of the poor response to last year's appeal, every medical practitioner in active practice should again be asked to covenant a minimum of £1 to the B.M.A. Charities Trust Fund or to an individual medical charity."

He said that of the 42 new covenants he was glad to say that 25 of them came from Tunbridge Wells. An appeal letter had been sent to every member of the Division, and if there was no reply a follow-up letter had been sent and then a third letter. The Charities Fund had only gained £131 extra from the appeal last year. If every member of the Association covenanted £1 it would bring in £60,000.

Dr. COVE-SMITH said that if every Division could do the same as Tunbridge

---

* The word "active" refers to the patient being at that time under the clinical care of the doctor.

Wells, what an influence it would have on the Association's charitable funds.

The motion was carried.

Dr. COVE-SMITH moved: "That the remainder of the Annual Report of Council under 'Charities' be approved."

He said that he had hoped to make a report to the Meeting about a proposed Medical Charities Year. However, this had not been possible. But progress was being made towards organizing such a year, and in due course the profession would be circularized on the subject.

The motion was approved.

Private Practice

Dr. I. M. JONES (Chairman, Private Practice Committee) moved: "That the Annual Reports of Council under 'Private Practice' (Docs. A.R.M. 2, paras. 137–163, and A.R.M. 2A, para. 290), Report on the Procedure for Selecting Candidates for Election to G.M.C. (Appendix IX), Terms and Conditions of Service of Police Surgeons (Appendix X), and Fees for Certificates and Reports (Appendix XI) be received."

Dr. Jones said that in introducing the report of the Private Practice Committee at this late hour he would be brief, but he would direct the Meeting's attention to two particular items which had been included in the Supplementary Annual Report of Council. The first of those was the discount trading scheme which had been referred to by the Chairman of the Organization Committee. The arrangements for that scheme were well advanced though not yet crystallized. Dr. Jones said that he wanted to make something clear in reply to some letters which he had received expressing anxiety lest money that had been donated for an entirely different purpose should be deviated to this other activity. Independent Medical Services Ltd. had carefully considered that matter, and it had been precisely to allay such anxieties that the decision, which had been supported by the Council of the Association, to finance the discount trading scheme by special subscriptions which would be exclusively devoted to meeting the administrative expenses of the scheme, had been taken.

The second matter to which Dr. Jones wished to draw the Meeting's attention was that during the last few days of June negotiations with the Treasury had been completed on all major items covered by the Treasury agreement relating to part-time medical services. As a result all fees covered by that agreement would be raised by 10%, and the increase would be retrospective to 1 October 1966. That upward revision was in full accord with the arrangements for periodic review made between the Treasury and the Association following the report of the Royal Commission in 1960, and meant that with the sole exception of the six months' standstill imposed upon the nation by the Government, the full betterment factor adjudicated by an independent authority had been applied to those fees. Doctors would be paid at the new rates as from 1 July, and would receive the retrospective pay during the next few weeks.

Private Medical Services

Dr. Jones said it had surprised him and his committee that the dramatic announcement contained in the last paragraph of Section 140 of the Annual Report of Council had produced no motion of either assent or dissent upon the agenda. Dr. Jones thought perhaps its import had not been fully understood by the profession, and he quoted it for the benefit of representatives: "The Council, having reviewed the overall situation, considers that, in view of the totally inadequate finance and medical manpower available to the National Health Service as a result of short-sighted policies by successive Governments, a considerable expansion of private medical services is now imperative in the best interests of the community, and furthermore would encourage doctors to remain in this country. The Council will therefore take all action within its power to encourage participation by the profession in private practice in Britain."

Dr. Jones said he would try to explain why the Council had emphasized the importance of private practice. It was not because doctors wished to be richer, not because patients wished to get a wider choice, not because it sought to create a privileged class of patient, nor because it wanted to damage the National Health Service. "We want to promote private practice," he said, "because we must create new resources. It is not just more money that we require. We need more hospitals, more beds, more kidney machines, more clinics with better facilities. We must have better conditions for the profession so that fewer doctors emigrate. And we will get these things only by tapping unexplored and willing new sources of finance. That is why encouragement must be given to private practice, and that is why, in its obsessional concern with distributing existing resources equally, the Government is following a blind path."

Dr. Jones continued that the imperative necessity was to create new resources. The private, provident product had more to offer than the hard-pressed public purse. Let the Government have the bigness to encourage private practice, he said, and it would see then perhaps a real step being taken to prevent the threatening crumble and crash of the National Health Service.

Was it not lunacy that private clinics, in which patients exercised their choice and paid fees for their medical care, should be flourishing in Russia, in Yugoslavia, and in Socialist Sweden, while in Britain, which had done so much to preserve the essential freedoms for mankind, and established standards by which so much elsewhere was judged, little had been done by the profession to maintain a private sector of medical care, and much had been done to discourage it?

"I am well aware that I am not asking for efforts which will be free from pain, difficulty, and anxiety," declared Dr. Jones. "But . . . it is your duty to ensure that you hand on to those who will follow you . . . something better than that which you yourselves inherited. The public would respond if given a lead. There was a wide variety of choice available through the medium of Independent Medical Services Ltd. and the provident institutions. Each of them had been launched in the face of considerable difficulties and their defects were few. There could not be a town of any size in Britain which could not support a few family doctors providing a first-class service with the support of one of the available schemes.

The motion was approved.

Alternative Medical Services

The following motion by Lambeth was formally moved: "That this Meeting requests Council to introduce an item-of-service insurance scheme for private practice. Such a scheme of insurance for private practice must include medical care within hospitals and nursing-homes and should not be restricted to specialists."

Dr. JONES said there was no reluctance on the part of his committee to fulfil what Lambeth asked, but he must point out that, having taken all the expert advice it had been possible to obtain, the Committee had been advised that a project of that kind could not be set up without a fund of at least £200,000. In the next few months such a scheme would be investigated and the outcome made known to the profession.

The motion was passed as a reference to the Council.

A series of motions under the headings of "Drugs for Private Patients," "Fees for Services Outside the National Health Service," "Car-parking," and "Departmental Committee on Death Certification and Coroners" were approved as references to the Council.

Death Certification and Coroners

Mr. H. A. KIDD (Sutton) moved: "That Council be instructed to set up a new committee which shall include adequate representation of hospital and administrative staff for a review and clarification of the powers invested in coroners, with especial regard to post-mortems on hospital patients."

Mr. Kidd said that this was an important matter for everyone. The Government had been worried about the problem and had set up a committee. The preparation of evidence had been referred to the Forensic Medicine Subcommittee of the B.M.A. The subcommittee consisted of three general practitioners, three pathologists, three police surgeons, and a member of the Coroners' Association, but there was no consultant representative for the specialties of general medicine, general surgery, gynaecology, etc. His Division was concerned about this. The report of the subcommittee submitted to the Government's committee had not been published, and the subcommittee did not represent the consultants or general practitioners in the country, said Mr. Kidd.

Dr. A. SKENE (Council) agreed with almost everything the proposer had said, but asked the Representative Body to reject the motion. It was an instruction to the Council. Clarification and review were undoubtedly necessary on the powers invested in coroners, but the time was not opportune.

Dr. I. M. JONES also asked the Representative Body to reject the motion. He said the setting up of the Brodrick Committee by the Government had been the direct result of a report submitted to and unanimously approved by the Representative Body in 1964. That report had been the result of long discussions in which not only had a special committee of the Association been concerned but every major committee of the Association had been consulted before final approval of the report had been given by the Council and before it had been published in the Annual Report of Council for 1964.

That report had formed the basis of the evidence which had been given to the Brodrick Committee. The Forensic Medicine Subcommittee had been at great pains to give Mr. Kidd an opportunity to put his case to them. Every section of the profession that could be affected was represented in the deputation that gave evidence to the Brodrick Committee. Every point Mr. Kidd had made was fully dealt with in the report.

Mr. KIDD, in reply, said that the report had not been accepted by the Central Consultants and Specialists Committee, which considered it had not been properly consulted.

The motion was lost.

General Medical Council Election

Dr. I. M. JONES moved: "That the revised procedure for the support of candidates at General Medical Council elections, as set out in Appendix IX, be approved."

The motion was carried.

An amendment in the name of Rugby, "That Appendix IX be amended thus: (*a*) delete paras. (8) and (9) and add to para. (11): . . . (4) contain an election address by the selected candidates," was accepted.

Police Surgeons

Dr. I. M. JONES moved: "That the proposals of the Association of Police Surgeons of Great Britain as set out in Appendix X be approved."

Dr. H. FIDLER (Council) moved the following rider: "To add on page 66 of A.R.M. 2, item 5, in the scale of fees, new section (*h*) which would read: 'for services rendered to the police on Saturday afternoons, Sundays, and Bank Holidays the night rate will apply.'"

Dr. Fidler said that this was the policy of the Association and appeared to have been overlooked when the new proposals were being drafted.

The motion and rider were carried.

A motion by Mid-Glamorgan, "That this Meeting supports the principle that in each police division police surgeons be appointed on a contractual basis with adequate retaining fee plus item-of-service payment," was accepted.

A motion by Mid-Glamorgan, "That (with reference to Appendix X (Scale of Fees)) no certificate of fitness to be detained should be expected without medical examination," was accepted.

Certificates and Reports Paid for by Patients

Dr. I. M. JONES moved: "That, while reaffirming the policy that the fee to be charged is a matter for mutual arrangement between a patient and doctor, the list of recommended fees approved by the Representative Body in 1963 be increased as set out in Appendix XI to this report, and the additional recommended fees approved."

The motion was carried.

Emergency Sign on Doctors' Cars

The following motion by St. Marylebone was accepted: "That this Meeting recommends that as a vital necessity for the proper working of medical practice, doctors are allowed to have a distinguishing light on their cars when going to an emergency, and at all relevant times they should be allowed to show on their B.M.A. parking-badge their names and location."

Application for Postal Vote

The following motion by Rugby was accepted as a reference to the Council: "'That this Meeting considers that paragraph 10 of the Home Office's reply is absurd: accordingly it instructs Council to press for the wording of the medical certificate for postal voting to be amended to read: To ....I recommend that you be granted a postal vote on medical grounds for.........months* indefinitely* (*Delete as appropriate.) Signed .... Dated........................."

Medical Examination of Elderly Drivers

Dr. H. G. DOWLER (Gloucestershire) moved: "That this Meeting is dissatisfied with the outcome of discussions with the Motor Conference regarding the medical examination of elderly drivers, that it reiterates resolutions 191 and 192 of the Annual Representative Meeting 1966, and that it directs Council to reopen negotiations to this end."

Dr. Dowler said the resolutions referred to in the motion suggested, firstly, that the examination of elderly drivers should be undertaken by someone preferably other than the family doctor; and, secondly, that the procedure for such examinations should be similar to the procedure for ordinary life assurance examinations. The argument against the latter was that it would involve special administrative procedure and would raise the premium for elderly drivers' insurance policies. The wording of the certificate given by the Council in its report was very suitable when it was known the person could be passed to drive. The difficulty arose when the doctor was uncertain. Whoever stopped a man from driving his car would naturally be the subject of his resentment, which could be unpleasant. Insurance companies made cost the main reason for not falling in with the profession's wishes that the procedure should be carried out in roughly the same way as life assurance examinations. Dr. Dowler submitted the matter was serious enough to justify that cost. Though it was said a doctor could refuse to carry out such an examination, that was an awkward thing to do. "Regardless of what the life offices' feel about it, we ought to stick to our belief and say so," said Dr. Dowler.

Dr. B. L. ALEXANDER (Manchester) supported the motion, saying that doctors should not be put in the embarrassing position of having to examine their own patients and turning them down. It was of no account who paid for it. The B.M.A.'s policy was that such people should not be examined by their own doctors. "Let us say that fairly and squarely," said Dr. Alexander.

Dr. J. E. MILLER (Council) opposed the motion. He said that over many years the Private Practice Committee had pursued the subject relentlessly, and every possible avenue had been explored in an attempt to find a solution. A doctor placed in such a position could refer the patient to a colleague to examine, which was the simplest solution of all.

Dr. H. C. W. BAKER (Council) was certain that the insurance companies' first consideration was not cost. What they did care about was the certificate. The companies knew it was not the elderly drivers who caused all the accidents. Some of them were the most careful drivers one could see on the roads, and their mileage was not great.

Dr. R. S. B. ROGERS (Gloucestershire) said this was already established Association policy. It had been agreed already that doctors did not want to carry out these examinations and wanted them done in the same way as life assurance. Dr. Rogers urged the Meeting to accept the motion and give support to a later amendment in the name of Gloucestershire.

Dr. B. D. MORGAN WILLIAMS (South Warwickshire) said it was upsetting to have to turn a man down for life assurance purposes. It was much more upsetting, possibly because it hurt his pride, to turn a man down and say he was unfit to drive.

Dr. I. M. JONES said that no further concessions from motor insurance companies were possible. Indeed, they had refused to discuss the matter, regarding the previous discussions as having been exhaustive. There were only two courses to follow. It could be said that what had been achieved already must be accepted, and agreement reached with the accident offices. Or, in the sense of a later motion by Gloucestershire, doctors could be directed not to do these examinations. Before the latter course was taken the Meeting should ask itself how many doctors would heed that advice for long, and how foolish the B.M.A. would look if its advice was widely disregarded. "Prudence demands you accept what has been achieved," said Dr. Jones.

Dr. DOWLER, in reply, said that the principle was to make sure that the right people were insured for driving on the roads. What was required to ensure that was a proper history, examination, and an independent assessment.

The motion was lost.

A motion by Worcester and Bromsgrove, "That the opinion of this Representative Body is that the best person to decide whether an elderly patient is fit to drive is his own family doctor. The extent of the examination should be left to the doctor and the fee to be charged should be a matter between the doctor and his patient," was, by leave, withdrawn.

A motion by Cleveland and Middlesbrough, "That (with reference to para. 160 of the Annual Report of Council) this Meeting accepts the proposed form but recommends that the said form be sent by the insurance offices to applicants and not to family doctors," was passed as a reference to the Council.

A motion by Mid-Essex, "That a second paragraph be added to the suggested certificate concerning the fitness of an elderly person to drive reading 'I recommend that he/she be referred for a second opinion,'" was, by leave, withdrawn.

A motion by Newcastle upon Tyne, "That this Body considers that the present method of issuing driving licences to private drivers is grossly inadequate in that no real effort is made to confirm that the minimum medical standards, as stated on the application form, exist," was accepted as a reference to the Council.

A motion by Aberdeen and Kincardine, "That this Meeting considers that the fee for emergency treatment under the Road Traffic Act, 1960, is grossly inadequate," and an amendment to add the words, "and that steps be taken to see that the fee is paid to the doctor first attending the patient whether this be at the scene of the accident or at hospital," was carried as a reference to the Council.

Emergency Treatment Service

Dr. R. Peters (Redbridge) moved: "That the A.R.M. views with great concern the activities of the B.M.A. Emergency Treatment Service in the Greater London area and regrets the lack of liaison and co-operation of the central advisory committee with local Divisions. It urges that the central advisory committee exercises its proper authority by restricting the activities of the B.M.A. Emergency Treatment Service to those areas and those Divisions which request its assistance and have established local advisory committees."

He drew the Meeting's attention to the opening sentence of the Association's Emergency Treatment Service booklet, which stated that the service began in 1963, extending a year later to incorporate a telephone answering service. In one borough of his Division a comprehensive scheme of that nature planned, organized, and financed by the local practitioners had been continuously and successfully operating since 1948. This, he thought, was some justification for proposing the motion.

The service appeared to be pressing to establish itself in the Division's area without the formation of a properly constituted local committee to include representation from local medical committees, hospital staff committees, and public health departments. This was completely at variance with the introductory statement of the Chairman of the Central Advisory Committee in the booklet.

Dr. J. E. Miller (Council) said the inference might be drawn from the motion that the Emergency Treatment Service was being introduced without local doctors asking for it. The E.T.S. had been requested by doctors in various areas throughout the country. It was reasonable that the service should explore the possibility of introducing itself into particular areas. It was not true to say the service had not taken cognizance of local committees. Discussions had been going on with them and with the Metropolitan Counties Branch of the B.M.A. He asked the Representative Body to reject the motion.

Dr. W. P. Lambie (Sheffield) said it had ben agreed that the service should be made available to members. An assurance had been given that it would not be introduced where there was no demand. The service had become a part of life in the Sheffield area. The B.M.A. was now offering it to everybody and its acceptance should not be prevented.

Dr. G. Cormack (Newcastle upon Tyne) said it was implicit in the wording of the motion that some sort of monopoly should be created in the Greater London area. The service could do nothing but good, and it had proved its worth. He asked the Representative Body to reject the motion.

Dr. W. G. A. Riddle (Gateshead) disliked the implications in the motion rather than the exact wording. He had been a member of the local advisory committee on Tyneside since the inception of the E.T.S. in that area, and it had always had the greatest co-operation from the central advisory committee in London. It was difficult to see how the service could operate in any area until a local advisory committee had been established. It would be improper for it to do so.

Dr. I. M. Jones asked the Representative Body to reject the motion. It was false from beginning to end. The first part accused the service of lack of liaison and consultation. There had been informal discussions between himself, some colleagues on the central advisory committee, and the chairman of the Metropolitan Counties Branch Council. Subsequently the introduction of the service had been welcomed. There had been no word of dissent. The service had been a boon in every area and had attained a higher standard than anything else in existence of its kind.

Dr. Peters, in reply, said the motion was not anti-B.M.A., and his local area was not trying to obstruct the establishment of the E.T.S.

The motion was lost.

A motion by the Chairman of the Private Practice Committee, "That the remainder of the Annual Reports of Council under 'Private Practice' be approved," was carried.

A motion standing in the name of North Middlesex, "That this Meeting feels that the statutory fee for notification of diseases to local health authorities should be double," was accepted as a reference to the Council.

Annual Meetings

Professor F. E. Stock moved: "That the Annual Report of Council under 'Annual Meetings' (Doc. A.R.M. 2, paras 174–180) and the Report on Annual Meetings of the Association (Appendix VIII) be received."

He said the matter had been reported in considerable detail, and there was nothing further he could add.

The motion by the Chairman of the Annual Meetings Committee, "That the report 'The Annual Meetings of the Association' as amended (Appendix VIII) be approved and its recommendations adopted," was carried.

A motion standing in the name of Southampton, "That the Annual Representative Meeting should take place in London at the earliest opportunity, and certainly much before 1971," was, by leave, withdrawn.

Scotland

Dr. J. Riddell (Chairman of the Scottish Council) moved: "That the Annual Report of Council under 'Scotland' (Doc. A.R.M. 2, paras. 225–247) be received." He reported that during the year the Scottish Council had given evidence to no fewer than nine commissions or special committees, including those on medical education, senior nursing staff structure, local government in Scotland, and social work services. It had also considered the best way of applying the new constitution in Scotland.

The G.M.S. Committee (Scotland) and the C.C. and S. Committee (Scotland) reported to the Scottish Council, so the viewpoint was obtained of all sections of the profession.

Scottish House was now graced by a portrait of Dr. E. R. C. Walker, lately Scottish Secretary. Scotland had suffered severely in the loss of Dr. Kate Harrower. Dr. Riddell expressed the indebtedness of the Scottish Council to the present Scottish Secretary, Dr. S. J. Hadfield, and to Dr. C. D. Falconer, Assistant Scottish Secretary.

Constitution of Scottish Council

Dr. Riddell moved:

"That the Schedule to the By-laws be amended to include under members of Scottish Council otherwise appointed 'Three (two of whom must be departmental medical officers) appointed by public health service members in Scotland; five appointed by regional consultants and specialists committees in Scotland and two appointed by the Hospital Junior Staffs Group Council (Scotland)'; and to delete under Duties and Powers of Scottish Council the sentence 'The Scottish Council shall have power to add to its number not more than three members specially qualified to assist in the business of Scottish Council.'"

He said that the Scottish Council contained within its representation a member from every Division in Scotland, but this meant that there was a preponderance of general practitioners. In order to move with the times and to increase the representations of other sections of the profession it was proposed to alter the constitution as in the motion. This would enable junior doctors, public health members, hospital staffs, and university staffs to have an adequate say in Scottish business.

The motion was carried by the necessary majority.

Dr. Riddell moved: "That the remainder of the Annual Report of Council under 'Scotland' be approved."

The motion was carried.

Northern Ireland

Mr. H. I. McClure (Chairman, Northern Ireland Committee) moved: "That the Annual Report of Council under 'Northern Ireland' (Doc. A.R.M. 2, paras. 248–258) be received."

He drew attention to the question of the administrative practice of hospital management committees and to the anxiety felt by the Committee at any attempted reduction in the influence of medical staff. It was proposed to interpose another committee between the group medical advisory committee and the hospital management committee. It would contain lay people and it would have no effective advice from doctors. That would abolish the system of medical superintendents of hospitals.

Dr. I. McD. Brown (Eastbourne) moved: "That the Representative Body notes the concern expressed by Northern Ireland about the proposal made to base hospital administration on a system of possibly non-medical executive management with medical advisers, rather than on medical executive authority."

Mr. McClure said he was happy to have support from Eastbourne.

The motion was carried unanimously.

Mr. McClure moved, and it was carried, "That the remainder of the Annual Report of Council under 'Northern Ireland' be approved."

Wales

Mr. R. J. Williams (Chairman of the Welsh Committee) moved: "That the Annual Report of Council under 'Wales' (Doc. A.R.M. 2, para. 259) be received."

He said that a major part of the activity of the Welsh Committee this year had been taken up in preparing the final draft of its report on Wales as a pilot area for area health boards, according to a resolution of the Council of 2 December 1964. A progress report was approved by the Committee in May 1966 and subsequently circulated for comment to B.M.A. Welsh Divisions, the Welsh Association of Local Medical Committees, the Welsh Regional Public Health Committee, the General Medical Services Committee, the Central Consultants and Specialists Committee, the Public Health Committee, the Society of Occupational Medicine, the local medical committees in Wales, the Full-time Medical Teachers and Research Workers' Committee, and the Occupational Health Committee. Thus a broad spectrum of opinion and criticism had been obtained and formulated in the final draft drawn up by the subcommittee and approved by the Welsh Committee on 27 June for submission to Council.

The Welsh Committee had been deeply concerned at the proposal in the new Constitution to reduce the number of Welsh members of Council from three to two. Membership of the Association in Wales was giving rise to concern (it was in fact only 66.5% of the doctors in Wales), and the comparatively low percentage membership gave a false picture of the apparent satisfactory representation of one Council member to 1,150 members of the Association in Wales.

The Committee had proposed that the Chairman be *ex officio* a member of the Council, and it failed to comprehend any logic in the Council's proposal that the Chairman would be able to participate in Council proceedings but not have a vote. There was deep resentment in Wales at the decision, despite representations to the Organization Committee, and if a third Welsh member with full voting rights be not admitted to the Council the Welsh Committee considered that the future of the Association in Wales might well be bleak.

The motion was approved.

Dr. D. L. Williams (East Denbigh and Flint) moved: "That the Welsh Committee be renamed the Welsh Council and function on the same basis as the Scottish Council."

The Chairman asked the Representative Body to agree that the motion should be moved as a reference to the Council, and the Meeting agreed.

Dr. Ronald Gibson (Chairman of Council) said he was not happy about it, because the situations in Wales and Scotland were quite different. Scotland had its own Health Department, for example. He personally preferred that the motion should be put to the Meeting.

The Chairman: "The Meeting has already agreed to vote on it as a reference to the Council, and we must debate it on those lines." Mr. R. J. Williams (Chairman of Welsh Committee) said it had been approved by the Welsh Committee as a reference.

A speaker from the floor asked how many times had the Welsh Committee met in the past 12 months. Mr. Williams: "Twice."

Dr. D. L. Williams, in reply, said that Wales had a Board of Health. He was surprised that representatives had not heard of it. The Welsh Board of Health was the Ministry of Health's Department in Wales. It was quite separate from the Ministry. He hoped that that was understood.

The motion was carried as a reference to the Council.

Mr. R. J. Williams (Chairman of Welsh Committee) moved: "That the remainder of the Annual Report of Council under 'Wales' be approved."

The motion was carried.

Medical Films

Dr. Ronald Gibson moved, "That the Annual Report of Council under 'Medical Films' (Doc. A.R.M. 2, paras. 195–199) be received," and this was agreed to.

Dr. Gibson then moved, "That the Annual Report of Council under 'Medical Films' be approved," and that was also agreed.

Alcohol and Road Accidents

Dr. Ronald Gibson moved: "That the Annual Report of Council under 'Alcohol and Road Accidents' (Doc. A.R.M. 2, para. 201) be received."

The motion was carried.

Dr. Ronald Gibson (Chairman of Council) moved, "That the Annual Report of Council under 'Alcohol and Road Accidents' be approved."

The motion was carried.

Press and Information

Dr. Ronald Gibson moved: "That the Annual Report of Council under 'Press and Information' (Doc. A.R.M. 2, para. 202) be received."

The motion was carried.

Dr. Ronald Gibson moved: "That the Annual Report of Council under 'Press and Information' be approved."

The motion was carried.

Dr. G. Cormack (Newcastle upon Tyne) moved: "That the Representative Body requests Council to investigate the possibility of familiarizing certain key members of the Association in television and other public relations techniques."

He said that centrally and in the provinces public relations promotion could be done with great effect by a relatively small number of key men in the Association who were fully proved in Association affairs and who had some experience and knowledge of the techniques of television.

Dr. Ronald Gibson said it might not have escaped the notice of Dr. Cormack that in fact the B.M.A. had been concentrating as much as it could on its Secretary (Dr. Derek Stevenson), who had been appearing on television on every possible occasion on matters involving the Association. He did not want to publicize too much the question of training speakers, but he would be prepared to support others in trying to get seminars going.

Dr. Cormack said his motion was intended as a reference to the Council.

The motion was carried as a reference to the Council.

Other Association Activities

Dr. Ronald Gibson moved: "That the Annual Reports of Council under 'Other Association Activities' (Doc. A.R.M. 2, paras. 278–288, and A.R.M. 2A, paras. 292 and 293) and the Report on Identification of Tablets (Appendix XII) be received."

The motion was carried.

G.M.C.: Annual Retention Fee

Dr. A. M. Rankin (Council) moved on behalf of Cumberland: "That this Meeting rejects the principle of an annual retention fee by the General Medical Council."

He pointed out that only 11 out of 47 members of the General Medical Council were elected by the profession. If the principle of an annual retention fee was accepted, expenditure on the G.M.C. was being underwritten without effectively being able to control it. What would in fact happen when a doctor ceased to pay the annual subscription to the G.M.C. had by no means been settled. He saw no reason why doctors should have to meet the cost of what was described in the Annual Report as "heavy expenditure for additional accommodation which was urgently required." Obviously the accommodation of the G.M.C. should be provided by itself.

Dr. G. R. Smith (Birmingham) asked: When a practitioner had paid his registration fee in the belief that it was for his professional lifetime, what was the position if the General Medical Council asked for an annual retention fee? If the practitioner refused to pay an annual retention fee would he be removed from the *Register*?

Dr. Ronald Gibson said he thought that the motion went too far.

Expressing himself as against the motion, Dr. J. R. Bennett (Council) said that the burden could not be placed on the newly qualified and registered doctors. They could not bear the whole cost. Other organizations had an annual retention fee, and the Association could no longer resist it in the case of the G.M.C.

Dr. Outwin (Council) said it would be a mistake to let the General Medical Council become totally financed from Government funds. Saying it was right to oppose the motion, Dr. R. Maggs (Eastbourne) said the Meeting should support moves which had been proceeding for some time, "to get the G.M.C. out "of the red."

Dr. S. WAND said that the General Medical Council had failed to balance its annual budget. Its expenses had been high. It had to find more money. Comparable organizations had an annual retaining fee. He thought a retaining fee of £2 a small price to pay by doctors for the privilege of electing members of the G.M.C.

Dr. RONALD GIBSON said the profession would not want the G.M.C. to be "Government owned." Equally it was unfair that young doctors should have to carry the cost of the G.M.C. through an increase in the registration fee.

A motion, "That the question be now put," was carried by the necessary majority, and on the motion being put to the Meeting it was lost.

Dr. R. MAGGS (Eastbourne) moved: "That the amount of the annual fee (£2) which the General Medical Council propose should be levied for the retention of a doctor's name on the *Medical Register* is unjustifiably high."

He said that the Annual Report stated that £1 was inadequate but that £2 would be excessive. For these reasons Eastbourne was suggesting that the proposed fee was excessive and should not, therefore, be supported.

The motion was carried.

The following motion by Cleveland and Middlesbrough, "That this Meeting accepts in principle an annual retention fee but recommends that a life membership fee be payable in lieu," was accepted as a reference to Council. The Chairman ruled that the following motion by Blackpool and Fylde, "That Council should advise the General Medical Council that the initial registration fee should be increased as thought necessary, but that on no account should the registration fee be made repetitive," had been covered by the previous decision.

Motions under the headings of The European Economic Community, The Establishment of a Cervical Cytology Service, and Labelling of Containers were accepted by the Chairman as references to the Council.

A motion to approve the remainder of the Annual and Supplementary Reports of Council under "Other Association Activities" was approved.

Any Other Business

On the motion "Any other business," Dr. W. R. KING (North Glamorgan and Brecknock) moved: "That in future at Representative Meetings the Agenda be adhered to in strictly numerical order."

He said this was not intended as a vote of censure on anyone, but at times the proceedings had been confused and confusing. He thought it would be much easier if the Agenda were followed in numerical order, and he saw no reason why this should not be done in the future.

The motion was lost.

On the motion of Dr. F. G. TOMLINS (Waltham Forest), a vote of thanks to the Chairman and the Deputy Chairman was passed by a standing ovation.

Proceedings of Council

The first meeting of the Council of the Association for the session 1967–8 was held in Bristol on 10 July at the conclusion of the Annual Representative Meeting. Dr. RONALD GIBSON was in the chair.

After welcoming the new members of the Council, the Chairman formally moved that the Chairman of the Representative Body and the Chairman of Council be authorized to refer the resolutions of the Annual Representative Meeting to the appropriate committees.

The motion was carried.

Standing Committees

The Council then proceeded to the election of the standing committees, other committees, and representatives on outside bodies, for the session 1967–8.

Vice-President

It was reported that a letter had been received from Dr. J. O. Mercer (New Zealand) expressing his gratitude for the honour which the Association proposed to confer upon him by electing him a Vice-President of the Association.

Public Health Medical Officers

The Council received a letter from the Secretary of the County Councils Association and Association of Municipal Corporations expressing regret at the steps recently taken by the B.M.A. regarding public health appointments with local authorities. The County Councils Association and Association of Municipal Corporations said they were concerned at the possible effect of the actions of the B.M.A. on the public health service, and would welcome an opportunity of meeting representatives of the Council of the B.M.A. to discuss the position.

World Medical Association

The Council adopted a suggestion by Sir Clement Price Thomas, a Past-President of the W.M.A., which was supported by the Central Ethical Committee, that the Association should submit the following motions to the assembly of the World Medical Association in Madrid in September: "(1) That adequate instruction in medical ethics should be included in the medical curriculum. (2) That upon qualification each doctor be presented with a copy of the Declaration of Geneva and the Declaration of Helsinki and that at each graduation ceremony the Declaration of Geneva be read out by one of the graduates on behalf of the others."

Danish Medical Association

The Council received a report that Mr. N. G. C. Hendry (Aberdeen) had been appointed to represent the Association at the 85th Annual Meeting of the Danish Medical Association, to be held at Helsingør from 25 to 27 August.

Annual General Meeting

The 135th Annual General Meeting of the B.M.A. was held in the Anson Hall, University of Bristol Union, on Monday, 10 July. The President, Professor HAMID ALI M. KHAN, took the chair. At the conclusion of the formal business the meeting was adjourned until 8.30 p.m.

Extraordinary General Meeting

An Extraordinary General Metting of the B.M.A. was held in the Anson Hall, University of Bristol Union, at the adjournment of the Annual General Meeting. The President, Professor HAMID ALI M. KHAN, took the chair.

A special resolution to amend the Articles of Association, as published in the *British Medical Journal* (*Supplement*, 27 May, p. 138), was carried.

Adjourned Annual General Meeting

The Adjourned 135th Annual General Meeting of the Association was held at the University Great Hall, Bristol, on 10 July at 8.30 p.m.

Installation of President

The retiring President, Professor HAMID ALI M. KHAN, installed Mr. R. V. COOKE as President of the Association for 1967–8, and invested him with the President's badge of office. Mrs. HAMID ALI KHAN invested Mrs. R. G. COOKE with the President's Lady's badge.

Dr. RONALD GIBSON (Chairman of Council) proposed a vote of thanks to the retiring President for all he had done on behalf of the Association during his term of office, and particularly for representing the Association at the centenary celebrations in Canada.

The vote of thanks was carried with acclamation.

Delegates from Kindred Associations and Representatives of Overseas Branches

The CHAIRMAN OF COUNCIL then introduced to the President the following delegates from kindred associations and representatives of overseas Branches:

Dr. A. G. Boohene, Ghana; Dr. K. R. Borland, Canada; Dr. B. C. Cohen, West Australia; Dr. G. C. Dockeray, Kenya; Dr. J. A. Diaz, U.S.A.; Dr. K. A. Finck, West Germany; Dr. J. Fleischmann, U.S.A.; Dr. P. J. Fogarty, New Zealand; Dr. M. A. Kehoe, Ireland; Mr. R. Levy, Jamaica; Sir Leonard Mallen, Australia; Dr. R. M. H. Malone, Barbados; Dr. E. Moses, Trinidad; Professor M. G. Muazzam, Pakistan; Dr. J. St. L. O'Dea, Ireland; Dr. V. R. Patel, Kenya; Dr. H. H. Phillips, Ghana; Dr. A. Pederson, Denmark; Dr. Noel Reilly, Ireland; Dr. M. O. Rouse, U.S.A.; Dr. Lyon Playfair, Rhodesia; Dr. Marcel Poumailloux, France; Dr. F. T. A. Sevens, Belgium; Professor W. H. Struben, Netherlands; Dr. Zakia Shammeem, Karachi; Dr. E. Tan, Malaya; Dr. V. Thuraisingham, Malaya; Dr. P. Tienari, Finland; Professor Dr. J. Towpick, Poland; Dr. P. De S. Wijesekera, Ceylon; Dr. T. W. Wikramanayake, Ceylon; Dr. R. Winton, Australia.

Fellows of the Association

The CHAIRMAN OF COUNCIL next introduced to the President the following newly admitted Fellows of the Association:

Dr. R. Barrie, Taunton; Professor R. J. Brocklehurst, Plymouth; Dr. D. W. K. Buchanan, Dundee; Dr. A. G. Chamberlain, Charmouth, Dorset; Dr. H. M. Cohen, Birmingham; Dr. E. Colin-Russ, London; Dr. R. Cove-Smith, London; Dr. A. R. Fox, London; Dr. J. M. C. Gill, Inverurie, Aberdeenshire; Dr. R. E. Hadden, Portadown, Co. Armagh; Dr. J. S. Happel, Alresford; Dr. M. L. Hudson-Evans, London; Dr. F. R. B. H. Kennedy, Isle of Wight; Dr. H. B. Kilroe, Rochdale; Dr. Isaac Lipsedge, Birkenhead; Dr. H. B. Muir, Auchtermuchty; Dr. R. S. MacArthur, Stourport-on-Severn; Dr. R. G. Prosser-Evans, Langland, Swansea; Dr. Patrick Reel, Isle of Man; Mr. C. P. Robinson, Swansea; Dr. A. Robinson Thomas, Newton Abbot; Dr. L. J. Rosin, Darlington; Dr. H. P. Samson, Eccles, Manchester; Dr. Gerald M. J. Slot, Twickenham; Dr. Joan K. Sutherland, Edinburgh; Dr. L. J. Stoll, London; Dr. C. R. Nunan, Wallington; Mr. E. E. T. Taylor, Northampton; Dr. Ronald H. Vartan, Hucknall.

Association Prizes

The PRESIDENT presented the following Association Prizes:

Nathaniel Bishop Harman Prize, 1966, to John R. Bennett, M.D., M.R.C.P., of Liverpool, for his work on the differentiation of oesophageal pain from cardiac pain.

Sir Charles Hastings Prize, 1966, to W. D. Rees, M.B., B.S., of Llanidloes, for his dissertation on the mental and physical disabilities of 1,190 ordinary motorists.

Charles Oliver Hawthorne Prize, 1966, to Katherina D. Dalton, M.R.C.S., L.R.C.P., of London, for her work on the influences of menstruation.

Walter Jobson Horne Prize, 1966, to Ronald G. Macbeth, D.M., F.R.C.S., of Oxford, for his work in respect of laryngectomy, injection of oesophageal varices, frontal sinus surgery, and hypophysectomy.

The prize for 1967 has been awarded to Edwin G. Collins, M.B., F.R.C.S.Ed., of Aberdeen, for his work in connexion with the physiology and treatment of otitis externa.

Middlemore Prize, 1966, to Sohan Singh Hayreh, Ph.D., M.B., B.S., of London, for his work entitled "Pathogenesis of Oedema of the Optic Disc."

C. H. Milburn Prize, 1966, to J. Leahy Taylor, M.B., B.S., D.M.J., of Staines, for his dissertation entitled "The Adequacy of the Disciplinary Jurisdiction of the General Medical Council."

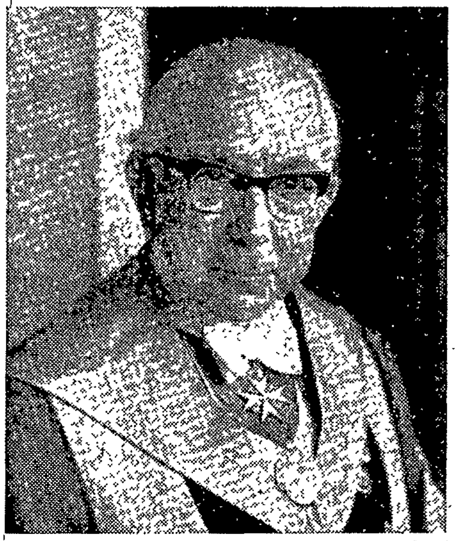
A second prize has been awarded to Werner K. E. Bernfeld, M.D., for his dissertation entitled "Medical Professional Secrecy, with special reference to Venereal Diseases."

Gold Medal

The CHAIRMAN OF COUNCIL announced that it had been resolved: "That the Gold Medal of the Association be awarded to the Right Honourable Lord Cohen of Birkenhead, M.D., D.Sc., Sc.D., LL.D., F.R.C.P., in recognition of his outstanding services to the Association and to the profession." He then read the following citation:

"Lord Cohen, in awarding you the Gold Medal of the Association, the Council is expressing its appreciation and gratitude for your tremendous services to medicine and to the medical profession.

"The pattern of your career was set, more than forty years ago, when you qualified at the University of Liverpool with first-class honours and distinction in every subject of the medical curriculum. Since then your career has been one of outstanding distinction.



Lord Cohen of Birkenhead wearing the Gold Medal of the Association.

"While still a relatively young man you were appointed Professor of Medicine at the University of Liverpool. You occupied this Chair with distinction for more than thirty years. As an outstanding clinician and as a medical statesman your unique gifts have been recognized by your presidencies of the Royal Society of Medicine, the Royal Society of Health, and other learned Societies. For six years you were chairman of the Central Health Services Council and many of its Committees. In 1961 you were appointed to the Presidency of the General Medical Council and the profession is happy to know that you continue in this office at this critical period of British medicine.

"Your wide reading and profound knowledge have led to many calls upon your time as a speaker. The numerous eponymous lectures and orations which you have delivered over the years, and your contribution to debates in the House of Lords, have been notable for their range of subject and lucidity of presentation. You have achieved a standard which few can emulate and have given immense pleasure to all who have heard you—whether members of the medical profession or not.

"Recognition of your many achievements has been widespread and you have received honorary degrees and fellowships from many universities and colleges both in the United Kingdom and overseas. In 1949 you received the honour of Knighthood, and in 1956 Her Majesty The Queen conferred on you a Barony, in recognition of your great services to medicine and to the community.

"Despite the demands of this very full life, the Association has always been able to call upon you for help and advice. The Association was honoured when you became its President in 1950 and after your distinguished year of office you continued to take a close interest in our affairs. Notable amongst the many services you have rendered the Association was the occasion of the celebration of the centenary of our Founder, when you delivered the memorial oration on 'Hastings and the General Medical Council.'

"We wish particularly to refer to the great influence you have had on medical education. You played a great part in the work of the first World Conference on Medical Education, though prevented by ill health from presiding over it. The reports of the two committees over which you presided, on the Training of the Doctor and of the General Practitioner, prepared at the beginning of the National Health Service, contained recommendations which were well ahead of their time. Any disappointment you may have felt at their initial reception some fifteen years ago must surely now be tempered by the current trends which follow so closely your original thoughts on training for general practice.

"The Association respects your pre-eminent place in Medicine. But its respect for you, Lord Cohen, goes deeper. It remembers with gratitude your kindliness, unfailing courtesy, and deep sense of humility. No call on your time has been refused. No task for the profession too small to undertake.

"We ask you to receive this Gold Medal as an earnest of the admiration and gratitude of all members of the Association for your magnificent leadership and achievement which will always be remembered in the history of British Medicine."

Presidential Address

The President, Mr. R. V. COOKE, then delivered his Address, "One Profession, One Purpose," which has been published in the *British Medical Journal* (15 July, p. 129).

Dr. A. N. MATHIAS, Chairman of the Representative Body, proposed a vote of thanks to the President for his address. This was carried by acclamation, and the 135th Annual General Meeting then terminated.

Representatives and their ladies then joined the President and Mrs. R. G. Cooke at a reception in the Bristol Museum and Art Gallery.

H.M. Forces

Appointments.—Group Captain D. O. Williams (surgical duties, Princess Mary's R.A.F. Hospital, Akrotiri, Cyprus); Wing Commander C. A. Bentley (to command, R.A.F. Hospital Khormaksar Beach, Air Forces Middle East); Wing Commander J. D. Crowlesmith (senior medical officer, R.A.F. Cottesmore, Rutland); Wing Commander W. J. L. Harries, O.B.E. (surgical duties, Princess Mary's R.A.F. Hospital Halton, Bucks); Wing Commander E. T. King (registrar, R.A.F. Hospital Nocton Hall, Lincs); Wing Commander J. D. MacAllister (senior medical officer, R.A.F. Henlow, Beds); Wing Commander B. Taylor (to command, R.A.F. Institute of Hygiene).

REGULAR ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Majors M. B. Macaulay, J. D. Macdonald, and J. E. Black have resigned their commissions.

Annual Meeting Religious Services

Official Service at Bristol Cathedral

The Service of Worship and Dedication at the B.M.A.'s Annual Meeting was held in Bristol Cathedral on Sunday, 9 July. At the Great West Doors the robed procession of the British Medical Association was met by the Dean, the Very Reverend D. E. W. Harrison, who also met the Lord Lieutenant of Bristol, His Grace the Duke of Beaufort, and conducted him to his stall. There followed the entry of the Civic Procession, led by the Lord Mayor of Bristol, Alderman the Reverend F. C. Vyvyan-Jones, also greeted by the Dean.

Trumpeters were provided by the 16th/5th the Queen's Royal Lancers, under the bandmaster, Mr. D. N. Taylor.

Dr. Ronald Gibson, Chairman of Council, read the first lesson, and Mr. Robert V. Cooke, President-elect, read the second lesson. Prayers were said by the Bishop of Malmesbury, the Right Reverend C. L. P. Bishop, and the Dean.

Concern for Persons and Truth

The sermon was preached by the LORD BISHOP OF BRISTOL, THE RIGHT REVEREND OLIVER TOMKINS, to a crowded congregation. He said: "We are all here with a common concern for persons and for truth. And in that common concern medical science and religious testimony are not as far apart as is sometimes suggested. We are all concerned for persons and we are all concerned for truth. And in that shared concern we are all aware of a shared polarity, or tension —a polarity between a given goal on the one hand, and on the other hand a considerable uncertainty about means."

Medicine, surely, accepted as given something which might be hard to define but which was concerned with health, with life as self-evidently valuable, with human beings as being so precious that endless patience, hard work, and devotion were rightly given to their care. The difficulties arose when they began to ask questions about the means by which the given goal was to be realized, for it was the very means themselves which posed the questions about the goal. They were all —whether doctors, clergy, teachers, or anyone else—living in an age when vast new resources of knowledge were calling into question the goals they sought, precisely because the means for reaching them seemed to challenge the goals themselves.

That had seemed to him to come out very clearly in some of the ethical questions in which medicine and religion had a common concern. He instanced the acute problems raised by the medical prolongation of life, abortion, birth control, and the survival of babies whose weakness or deformity would in earlier generations have meant their early death.

He continued, "It is easier to ask questions than to answer them. But a preacher is supposed to deal, in some sense, with answers." Taking as his text Colossians 1, verses 15–18, he said: "In Jesus Christ, the Christian faith affirms, the concern for persons and for truth meet in a Person who is the Truth. . . . Christ is the Logos of the Cosmos, the meaning of the world—He is the clue to what makes sense." He then dealt with four areas of Christian "answer" suggested by the passage from St. Paul reinterpreted in the thought of our own age.

On concern for persons, he said: "Whether a man would rate himself a churchgoer, or even a Christian, most of us would gladly admit that in Jesus we see supremely the right approach to people. He has been called 'the Man for others'—His whole life was one of deep concern and compassion; He cared for the whole man, body and soul alike, and He taught that to care about people was to care about God.

"In this aspect there can never be any separation between religion and medicine, and if over recent centuries the two have drifted away from each other it is partly because the Church has sometimes made a separation, which Jesus never allowed, between 'body' and 'soul'; it is partly due to the fact that the increasing complexity and effectiveness of medical science have appeared to owe nothing to Christian faith. But I am sure we can hope for more mutual sympathy at this point, as we all see ever more clearly that a person is an indivisible whole. His body, his mind, his unconscious motivations, his deepest beliefs, and his dependence upon others through heredity and environment are all so subtly related to each other that no aspect of a human being can be fruitfully considered without recognizing its connexions with all the other aspects."

Death in New Perspective

Death was put into a new perspective by Christ's perception that people had meaning only in relation to the God whom he called Father, and so life was grounded in a living God who had death itself under control. A doctor, both as a doctor and as a person, worked among those for whom death was not the last word, and who therefore need never in any final sense lose a patient—or, for that matter, a more deeply loved one.

St. Paul's conception of Christ's victory over "the invisible orders" must be reinterpreted in terms of our contemporary world picture. The phenomenon of man, as interpreted, for example, by Teilhard de Chardin, was to be understood as part of "the connexion between Christ and the known universe—no more intrinsically incredible than it was to St. Paul's contemporaries."

Finally, St. Paul's phrase, "He is the head of the body, the Church," implied that Christ did not stand alone, though He remained unique. He always fulfilled His universal work by calling men and women into a conscious co-operation with Himself in God's purposes.

Increasing complexity of problems demanded increased co-operation in answering them, said the Bishop in conclusion. "Life was meant to be a matter of relationship, of community, of co-operation. Society had no right to expect doctors to answer alone questions about abortion or euthanasia or contraception, in which parents, relatives, sociologists, teachers, theologians, and others all had their allotted part to play."

Roman Catholic Service

Mass was celebrated in the Pro-Cathedral, Park Place, Bristol, on Sunday, 9 July, at 5.15 p.m. The Bishop of Clifton, the Right Reverend J. E. Rudderham, officiated.

The BISHOP said that divine prophecies showed that there was a deep analogy between medicine and religion. Each involved a recognition that there was something amiss in human affairs. Doctors had to face physical and mental illness. The Church had to face sickness of the soul.

In the actual exercise of their respective ministries many doctors and many clergy would agree that the spiritual and physical or mental health of those to whom they ministered were often closely connected. The modern doctor could recognize there were times when the patient needed the divine more than the physician. The priest should recognize that of those who came to him with supposed spiritual problems some at least were more in need of medical help.

Doctors were doing the work of the Church when they carried out the work of their own profession. "We too easily suppose that the work of the Church is neither more nor less than the professional work of the clergy, but this is not so. The Church is the whole People of God, and she is in action wherever the believer, be he priest or layman, exercised the manifold charity of Christ."

The Church looked with lively interest and sympathy, and with a desire to help, on the efforts of her own sons and daughters in the medical profession. However, it might not be amiss to emphasize that not only would disease never be effectively conquered till man's spiritual ills had been healed but the bodily and mental ills of men were of a lower order of importance than his spiritual welfare and needs. "If bodily and mental health are good things they are so because they enable the human person to function normally and efficiently. But the ultimate good of the human person is something more than efficient functioning of his organism," concluded the Bishop.

Association Notices

Branch and Division Meetings to be Held

HUDDERSFIELD DIVISION.—At George Hotel, Monday, 24 July, 8.15 p.m., annual general meeting.

Correction.—Dr. D. S. HURWOOD moved the motion on the "Refund System" at the recent Conference of Representatives of Local Medical Committees (*Supplement*, 1 July, p. 3), not Dr. Whowell, as reported.

Overseas Conference of B.M.A.

The Overseas Conference of the B.M.A. was held in the University Union, Bristol, on 11 July. Dr. A. N. MATHIAS (Chairman of the Representative Body) took the chair in the unavoidable absence of Professor D. E. C. Mekie, Chairman of the Committee on Overseas Affairs.

After welcoming the overseas visitors the CHAIRMAN explained that the purpose of the conference was to have a frank exchange of views. The Association wished to be of every assistance to overseas branches, and was particularly anxious to know how it could best help overseas members when they came to the United Kingdom or Europe in organizing postgraduate study for them, or obtaining posts.

Before proceeding to a general discussion the Chairman invited Dr. D. L. Gullick, the Secretary of the Committee on Overseas Affairs, to report on the work of the Committee, and Dr. R. A. Pallister, the Medical Director of the Commonwealth and International Medical Advisory Bureaux, to talk about the Commonwealth Immigrants Act.

Commonwealth Foundation

Dr. D. L. GULLICK (Under Secretary) said that one of the most important events of the past 12 to 18 months had been the establishment by Commonwealth Governments of the Commonwealth Foundation in London, to which almost every Commonwealth country now belonged and subscribed. The Foundation had a fairly large sum of money which it could use to encourage intraprofessional contacts within the Commonwealth. Doctors did not have a prior call on the fund, and had to line up with architects, lawyers, engineers, dentists, and others. However, the Director of the Commonwealth Foundation had been very co-operative and a substantial grant had been made towards the cost of the Commonwealth Medical Association meeting in Karachi, and more recently to that of the Council of the Caribbean Branches.

The meeting of the C.M.A. Council in Karachi had been one of the highlights of the year, said Dr. Gullick. Most member associations had been represented, and a lot of hard work had been done in pleasant surroundings during one week. Several important decisions had been taken to strengthen the links between Commonwealth medical associations, and Dr. D. Stevenson, the Secretary of the B.M.A., had been working hard to implement those decisions. Regrettably, said Dr. Gullick, it had not yet been possible to implement one of the more important decisions, the resolution by the C.M.A. Council to appoint a travelling Fellow. The doctor appointed would be an eminent member of the profession who would travel round the world lecturing to member associations on clinical matters. He would also collect information about the C.M.A. and bring back first-hand reports of the problems of members, thus facilitating the exchange of information, which was so important.

In recent years constitutional changes within the Commonwealth had been followed by constitutional changes in the overseas branches of the Association, continued Dr. Gullick. During the past twelve months the Sierre Leone Branch had been dissolved and had been succeeded by the Sierre Leone Medical and Dental Association. The Medical Association in Rhodesia had established itself as an independent association, as had the Nigerian Medical Association, and very recently colleagues in New Zealand had taken a similar step.

Commonwealth Immigrants Act

Dr. R. A. PALLISTER explained that, as Medical Director of the Commonwealth and International Medical Advisory Bureaux, his work was concerned with assisting doctors visiting this country.

Referring to the Commonwealth Immigrants Act, passed in 1965 to control immigration to Britain, Dr. Pallister said that certain difficulties which affected doctors had arisen out of the Act. Under the Act there were three groups of people concerned: the first of these were the men who had jobs to come to in this country and who therefore obtained employment vouchers without difficulty. The second group comprised those who had some skill which was useful in this country. They could obtain an employment voucher without having jobs to come to, which was important from the doctors' point of view. The third group consisted of unskilled people without jobs to come to.

Dr. Pallister said that when the Act was first passed a Commonwealth doctor was able to obtain a voucher within weeks of making application, then the period became extended to six and eight months, and now it sometimes took more than a year to obtain a voucher. A person coming to this country without a voucher usually came with a tourist visa, and was allowed to stay for a certain period. He was expected to have sufficient funds to keep him during his visit. A doctor coming here in those circumstances normally had an extension of time granted if he was offered a hospital appointment. However, he could not stay indefinitely. A student could also be similarly admitted for a course of study. The problem was that there was no certainty that a doctor without an employment voucher would be allowed to stay for the length of time required for his purpose. That made it difficult if he had to spend a considerable sum of money travelling to Britain. Dr. Pallister said his experience had been that the Home Office used its discretion in favour of the doctor who wished to work for a time here, but the situation needed clarifying.

Australian Views

Mr. C. O. F. RIEGER (Australia) said that students coming to the United Kingdom for postgraduate study were grateful for the help they received from the Commonwealth and International Medical Advisory Bureaux. He said that the Australian Medical Association wished to maintain the closest possible ties with the B.M.A.

Referring to the Australian edition of the *British Medical Journal,* Mr. Rieger said that at first the Australian Medical Association had not welcomed it. It had been thought that it would detract from the A.M.A.'s own journal in terms of advertisements. So far, however, that did not appear to have happened. He personally found it very valuable to be able to keep in close touch with the B.M.A. through the Australian edition of the *B.M.J.*

Dr. G. C. DOCKERAY (Kenya) said that, on the whole, the relations of the medical profession with the Government and Ministry of Health in Kenya were good. House-officers in hospitals were overworked at the moment, and Dr. Dockeray suggested that it might help them if publicity was given to that fact.

Dr. V. R. PATEL (Kenya) said that certain Commonwealth countries feared that if Britain joined the Common Market connexions and relations with the Commonwealth would be severed, whereas relations between the B.M.A. and the overseas associations needed to be closer than ever.

"B.M.J." Overseas

Dr. M. WARE (Editor, *B.M.J.*) said that he had been interested to hear from Mr. Rieger of the reactions in Australia to the Australian edition of the *B.M.J.* In launching this edition it had been realized that one of the most important ways of maintaining contact was the speed with which the *B.M.J.* reached its readers, and doctors in Australia could now receive their copy within a few days of publication. A lot of thought had been given to the question of advertising. The *British Medical Journal* had been concerned that no damage should be done to the *Medical Journal of Australia,* and from experience of the pharmaceutical industry in Britain it had been thought that there was no serious threat. It had been gratifying to learn that this had proved to be correct. A number equivalent to half of those who had been receiving the *B.M.J.* by surface mail at the end of last year were now subscribing to the new edition.

The *British Medical Journal* thought of itself as an international journal, continued Dr. Ware. Some 26,000 copies went overseas, and members of the journal staff had been visiting medical schools in the Commonwealth and elsewhere overseas to find out at first hand how the service could be improved. When these visits were made one of the first requests usually received was for greater speed in delivery of the *B.M.J.* This was the main reason why the Australian venture had been undertaken.

Efforts were also being made to speed up the delivery of the *B.M.J.* to English-speaking medical schools in the Far and Near East and in Africa, and there was now more emphasis in the *B.M.J.* on the problems of tropical medicine.

Irish Medical Association

Dr. J. ST. L. O'DEA (Republic of Ireland) reported that relationships between the Irish Medical Association and the Department of Health in Ireland had remained good, and there was constant communication between the two bodies. The problems of the Irish Medical Association were shared by many other professional bodies in Ireland, and the Association had taken the initiative and had formed an organization known as the Federation of Professional Associations. The object was to obtain co-operation in the approach to certain problems which were common to the various professional bodies.

Membership of the I.M.A. had dropped a little for a couple of years, said Dr. O'Dea, but it was now restored to its former size. The Association had major committees working on infant mortality, poisons, and drugs, and their useful work had improved the image of the I.M.A.

Dr. C. VAUGHAN (Trans-Atlantic Territories) said that the new hospital of 600 beds in Barbados, which had been opened in 1964, had begun to take medical students for the first time. For the third year running there had been a seminar held in conjunction with McGill University and in his view this would become an annual feature.

Half of the senior doctors in these territories were in private practice, he said, and wished to maintain their ties with the B.M.A.

On the debit side, Dr. Vaughan said that specialists were expected to work for a salary of about £1,800 a year, which was supplemented by the Ministry of Overseas Development. There was also victimization in what he described as the "federal nonsense." Doctors born in the federal territories could not qualify for an inducement allowance. This meant that people from other countries could obtain a higher rate of pay than those born in the former federal territories. If all the salary scales were brought into line there would be no need to pay an overseas allowance.

Dr. Vaughan said that the central Government had taken over the district medical services in some places, but it was too early to say whether it would be of advantage or not. He suggested that the raising of the university fees in Britain from £75 to £250 required urgent consideration.

Dr. PAUL J. FOGARTY (New Zealand) brought greetings from the Medical Association of New Zealand, and he said that relations with the B.M.A. had altered very little as a result of the change in name and status of his Association. He thanked the B.M.A. for the honour done to the New Zealand Association by the election of Dr. J. O. Mercer as a Vice-President of the B.M.A. Dr. Mercer had been editor of the *New Zealand Medical Journal* for about 26 years.

Problems in Malaysia

Dr. V. THURAISINGHAM (Malaysia) said that a problem facing the Malayan Medical Association upon which guidance was required was that the Government had refused to negotiate with the association on terms and conditions of service of Government-employed doctors, the reason being that the Government would negotiate only with a registered trade union. Therefore, as a result of the association's inability to represent these doctors, they had formed a subdivision of the association called the Senior Government Officers Association.

An exchange scheme had been suggested some time ago, said Dr. Thuraisingham, between Malaysian and British doctors, and the idea had been mooted that senior registrars from the Liverpool Regional Hospital Board would be sent out to work in Malaysia, and Malaysian doctors would receive postgraduate training in Liverpool. It had been thought that such a scheme would be mutually beneficial, but the negotiations had fallen through. An effort had been made to revive the scheme two years ago, but the Malayan Medical Association had been informed by the Ministry of Health in Malaysia that in view of the formation of the Commonwealth Foundation the scheme would be best dealt with by that foundation.

Dr. Thuraisingham reported that "quack" doctors were appearing in large numbers throughout his country, and at the moment there was no effective legislation to curb them. The association was endeavouring to educate the public to recognize the properly trained doctors as opposed to the quacks. He said that on the question of ethics the Malayan Association had usually followed the B.M.A. code of ethics as a guide, but the code was not always workable in Malaysia, and it was in the course of being modified.

Dr. P. DE S. WIJESEKERA (Ceylon) told the Conference that owing to difficulties in Ceylon young doctors were unable to come to Britain for postgraduate experience unless they had a job to come to. Therefore he asked the Committee on Overseas Affairs to consider obtaining temporary appointments for these young doctors from Ceylon for possibly three or four months in the first instance.

Professor M. G. MUAZZAN (Pakistan) said it would also be of great help if doctors in Pakistan who wished to come to the United Kingdom for training could be found appointments before they left Pakistan. He urged reciprocity in respect of medical degrees and the setting up of a secondment scheme. He thought that the raising of students' fees in Britain would result in many students turning elsewhere for their training.

Dr. E. A. MOSES (Trinidad and Tobago) said it should be impressed upon the Home Office that if a doctor came from overseas for a postgraduate course he should be given sufficient time to complete the course, and not be subjected to the embarrassment of re-applying every six months, as had been his own experience.

In Trinidad the large increase in students' fees was considered a great burden, said Dr. Moses, particularly as the majority of students who came to Britain from Trinidad to study medicine usually came under their own steam.

As far as the *British Medical Journal* was concerned, it was important from the point of view of correspondence and notices of appointments that some copies should be sent by air to Trinidad. At present the *B.M.J.* was not received until at least four weeks after publication, which was far too long.

Referring to the question of Britain's entry into the Common Market and its effect on the standard of medicine, Dr. Moses reminded the Conference that Trinidad and Tobago had reciprocity with the General Medical Council, and he wondered how practitioners in his country would be affected if Britain entered the Common Market.

Finally, he said that salaries and conditions of service of Government-employed doctors in his area were generally far from satisfactory.

Higher Qualifications

Dr. H. H. PHILLIPS (Ghana) reported that the first graduates would be coming from the medical school in Ghana in June 1969. It was hoped that those graduates would be able to go all over the world for their post-graduate training, and that therefore the difficulties in connexion with the Commonwealth Immigrants Act would be overcome. Dr. Phillips said that an ever-increasing number of graduates and specialists from Ghana wanted to take higher examinations in the United Kingdom, but there were difficulties in that connexion, and Dr. Phillips asked whether consideration could be given to the possibility of establishing examination centres outside Britain.

He said that those concerned in Ghana were also alarmed at the big increase in fees for students in the United Kingdom.

Dr. W. HEDGCOCK (Principal Deputy Secretary), speaking about the Common Market, said that a legally recognized medical practitioner of any member State would be recognized by any other member State in which he practised. That meant that the registration methods in the countries concerned would be modified to enable that to happen. Once a doctor settled in the new country, he would have to obey the laws which obtained in that country.

Professor HAMID ALI M. KHAN (Immediate Past-President) pointed to an anomaly in the present situation which allowed a doctor to come to the United Kingdom, but which did not allow him to bring his wife if she happened to be a student.

The CHAIRMAN assured the Conference that the various points which had been raised would be considered by the Committee on Overseas Affairs at its first meeting of the session. He also gave an assurance that whether the United Kingdom went into the Common Market or not the associations which were affiliated to the B.M.A. and the Branches which were part of the B.M.A. would always be of prime consideration. The B.M.A. realized the immigration difficulties which were now being experienced by Commonwealth doctors coming to this country, and when sufficient material was to hand Dr. Mathias thought that the matter would be taken up with the Home Office.

Professor F. E. STOCK referred to the increase in overseas students' fees, and said that the Committee of Vice-Chancellors and the University Grants Committee had made the strongest possible protest in the matter. Every university in the country was anxious that the fees should be reduced. Referring to Dr. Thuraisingham's remarks about "quack" doctors, Professor Stock suggested that the Malayan Medical Association could possibly obtain help by studying the Hong Kong legislation, which prohibited practice by unregistered practitioners.

The conference then ended, and representatives attended a reception for overseas visitors at the Zoological Gardens, Clifton, by invitation of the Commonwealth and International Medical Advisory Bureaux.

The Chairman of the Representative Body, Dr. A. N. MATHIAS, proposed the health of the Overseas Representatives and Dr. V. R. PATEL (Kenya Medical Association) replied.

Dangerous Drugs Act: Restoration of Authority

The Home Office announces that the authorities granted by the Dangerous Drugs Regulations under the Dangerous Drugs Act, 1965, have been restored to Dr. J. Millar Matthew (Croydon, Surrey).

Christian Medical Fellowship

An address entitled "Science: its own Arbiter?" was delivered by Mr. ARNOLD S. ALDIS, Assistant Director of the Surgical Unit, the Welsh National School of Medicine, Cardiff, at the annual breakfast of the Christian Medical Fellowship held in Bristol on 11 July. Mr. ROBERT V. COOKE, President of the B.M.A., was in the chair.

Mr. Cooke introduced Mr. Aldis to the large gathering, which included Sir Clement Price-Thomas, a former President of the Association.

Codes of Conduct

Mr. ALDIS said that medicine had always been closely associated from early days with ethics. Doctors had never equated what was possible or feasible with what was right, but they had always accepted the guidance of principles in the practice of their profession. Those principles had been crystallized from time to time in codes of professional conduct such as the Hippocratic oath. The codes were not derived from medicine or science. They had been imposed upon and accepted by the profession from outside sources, and were derived from religion, moral philosophy, and from the general *mores* of the age in which they operated.

Today a new situation was facing the profession. Scientists were claiming the right to draw up rules for the application of scientific knowledge. They were claiming the right to build ethics on science alone, and it was this situation which he questioned.

Mr. Aldis stressed the vital need for ethical teaching in medical schools and universities. He challenged the right or competence of scientists alone to supply ethical teaching. The need for ethical teaching, he said, stemmed from two factors operating in opposite directions. The first factor was the enormous advance in medicine itself. It had expanded out of all recognition, and with each expansion in medicine there were new ethical and moral judgements to be made.

Mr. Aldis said that their forefathers had had very few drugs and medicines for treatment of disease. Today commercial firms produced a whole range of potent drugs. These drugs had brought in their train new ethical problems.

Science and Ethics

The argument of the present-day scientist and humanist, that science must provide its own ethics, was based on the view that in the past scientists had had to accept an empirical ethic because their knowledge was insubstantial and their powers limited. Today the scientist's powers opened up new fields for ethical consideration. It required ethical judgements to know when and how to use the new, powerful drugs which were coming on to the market. In the field of surgery, new problems had arisen with new techniques. "We are entering the era of transplantation surgery, and the ethical problems raised by this have been intense," said Mr. Aldis. There were also problems of human experimentation.

There was a lapse in the use of the Hippocratic oath. Most universities had dropped it, for something more appropriate to the age. Most students met the Hippocratic oath for the first time when they attended their graduation ceremony. In the past, even if students were not taught ethical principles during their training, it was assumed that they had a knowledge of the Christian faith and the principles it embodied. That situation no longer held. Young people were growing up in a world where the Christian faith was very largely discarded. There was a need in the rapidly growing scope of medicine for ethical judgement, and yet to meet that demand there was a relative vacuum.

The problem of ethical principles was not only experienced by students but by those high up in the medical profession. There had been conferences on the subject, and a directive issued by the Medical Research Council indicated a disquiet about some of the principles that were being allowed to operate in research work.

C. P. Snow had said he was surprised that medical education had turned out to be less humane than might have been expected. Canon G. B. Bentley had said that science established facts, but that that did not give a person knowledge of what he ought to do. To make the transition you need a third factor, teleology. Scientists were claiming that this missing factor of teleology had been discovered in the theory and principle of evolutionary development. It was stated that ethical principles must be judged on whether they possessed survival value or not. If they did then the ethical principles must be right. If they did not the principles must be wrong. Evolution seemed to be strangely linked to survival. They must accept survival as being good, because evolution did not seem to work towards it and was indeed working the other way, towards its elimination. Was this idea of survival value an adequate guide? He believed not. He believed it was fatally easy to use that argument to justify almost any line of action.

The second principle was progress and the advancement of the race. That was equally susceptible to error. What was meant by improvement? Who was to decide what was improvement? Improvement alone was no sure guide.

The solution, said Mr. Aldis, lay in the Christian faith. Here was an ethic which alone was capable of meeting the challenge of the hour. Christian ethics provided not only a rule but means for obeying a rule. That was what the Christian faith offered. Science alone could not confer wisdom. It was in the Scriptures that "the fear of the Lord is the beginning of wisdom"; that there is "a good understanding for all they that keep His commandments."

Golf at Bristol

The results of the golf competitions held during the course of the B.M.A. Annual Meeting at Bristol are as follows: Notts Ladies' Challenge Cup, Dr. Mary F. Roche (winner), Mrs. A. Macleod (runner-up). Treasurer's Cup, Dr. D. B. Kerr (winner), Dr. J. S. K. Stevenson (runner-up). Leinster Cup, Dr. R. A. Bradwell. Childe Cup, Dr. D. B. Kerr.

General Medical Council

Disciplinary Committee

An additional meeting of the Disciplinary Committee of the General Medical Council was held on 17 July in order to consider certain cases which could not be taken in May. LORD COHEN OF BIRKENHEAD, the President of the Council, was in the chair.

Four cases of conviction were considered, including two in which an inquiry had previously been adjourned. The Committee also considered one application for restoration and one case of conduct.

Indecent Exposure

In the case of WILLIAM IRVINE HARDY, registered as of 7 Bedford Street, Belfast, in which the inquiry had been adjourned from November 1965, Mr. A. P. P. HONIGMANN (of Waterhouse & Co., Solicitors) reminded the Committee that on the last occasion Dr. Hardy had been unable to appear before it on medical grounds, and that the Committee had asked Mr. N. Leigh Taylor (of Messrs. Hempsons, Solicitors to the Medical Defence Union), who represented Dr. Hardy, to provide regular medical reports from the medical officer in charge of the hospital in which Dr. Hardy was a patient.

Mr. LEIGH TAYLOR gave a certificate to the Committee from the consultant psychiatrist looking after Dr. Hardy regarding his condition, and he suggested that, as his client had been committed to hospital by the magistrates in March 1965 following a conviction for indecent exposure, the Committee might feel able to decide that the case need proceed no further.

After a consideration *in camera* the PRESIDENT announced that the Committee had determined to adjourn the proceedings until its next meeting in November 1967, before which time it would require a further report on Dr. Hardy's condition, including the diagnosis in detail and any medical treatment which may have been given.

Mr. LEIGH TAYLOR said that he would endeavour to get the consultant psychiatrist looking after Dr. Hardy to attend as a witness when the hearing was resumed in November.

Failure to Keep a Register

The Committee next dealt with the case of NOEL PATRICK BURNS, registered as of 19 Balfour Road, Acton, London, in which the inquiry had been adjourned from May 1967.

Mr. HONIGMANN reminded the Committee that Dr. Burns had been convicted (after pleading guilty) at the Acton Magistrates' Court in December 1966 of failing to keep a register of dangerous drugs and had been fined £50 and ordered to pay ten guineas for costs. Last May Dr. Burns had been present at the inquiry but had not been represented and had not produced any evidence in mitigation of the charge. The Committee had for that reason decided to adjourn the case in order to give him an opportunity to produce evidence in mitigation.

On this occasion, said Mr. Honigmann, Dr. Burns was represented by Mr. John Lee, Counsel, instructed by Messrs. J. A. Hostettler & Co.

The conviction had arisen, continued Mr. Honigmann, as a result of a routine inspection of chemists' registers in the West London area. The police, on investigation, discovered that Dr. Burns had been purchasing unusually large quantities of morphine and pethidine, and had failed to keep a proper register. Mr. Honigmann, referring to Dr. Burns's earlier history, said that while in Canada at the time of the "Medicare" crisis in Saskatchewan it had come to the notice of the narcotics authorities there that Dr. Burns had begun to purchase and prescribe quantities of barbiturates and amphetamines which were not thought to be in accordance with the size of his practice. In reply to an inquiry by the authorities Dr. Burns had said that he felt he was the best judge of how he should run his practice and that he proposed to carry on as he did before.

Mr. JOHN LEE put in a letter from a doctor who had been treating Dr. Burns since 6 May 1967 for pethidine addiction and was confident that the addiction would be overcome.

Dr. BURNS told the Committee in evidence that after qualifying he had spent two years, from 1952 to 1954, in New York State working in a hospital, after which he had spent five years in Malaya in what was then the Colonial Medical Service. On returning to Britain he had worked with an emergency call service in London for two years, from his present address. It was largely as a result of this that he had come to take drugs. "Anybody out and about in the early hours," said Dr. Burns, "is suspected by the police of being out on some nefarious purpose. One gets stopped, and my work was being impaired to such an extent that I complained to the authorities suggesting a change in the law." Dr. Burns said that he had been convicted of speeding offences and had been disqualified from driving for 12 months. The effect of all this worry, combined with long hours, had led to his succumbing to the temptation to take drugs.

Asked by Mr. LEE whether the addiction had in any way impaired his efficiency as a practitioner, Dr. Burns replied, "No, I think it has improved it, probably." He said that he was receiving regularly weekly treatment from his doctor for the addiction.

Cross-examined by Mr. HONIGMANN, the witness said that he believed his addiction had improved his communicability with other members of the human race. He had at present about 100 N.H.S. patients and was doing a good deal of work for another doctor in the neighbourhood.

In an answer to questions by the LEGAL ASSESSOR, Dr. BURNS said that following his disqualification from driving he had gone to Canada for a year. He had, as outlined earlier by Mr. Honigmann, experienced certain difficulties concerning the prescription of drugs while in Canada, but this had arisen because of his not being conversant with the regulations. He strongly denied having done anything improper. In reply to a question by Mr. LEE, in re-examination, Dr. Burns said that no disciplinary proceedings had been taken against him in any State in Canada.

Mr. LEE submitted to the Committee that there was evidence to show that his client was overcoming his addiction and desired to be cured, and that his practice had not been impaired by this personal misfortune.

After a consideration *in camera*, the PRESIDENT announced that the Committee regarded the conviction with grave concern, especially in the light of Dr. Burns's earlier difficulty with drugs and the late date at which he had resorted to treatment. In order, however, to give him an opportunity of rehabilitating himself and of implementing the assurances given as to his future conduct the Committee had determined to postpone judgement until May 1969. It would, however, expect Dr. Burns to make an interim appearance at its meeting in November 1967. Shortly before that time he would be asked to furnish the names of professional colleagues, including a consultant psychiatrist, and other persons of standing to whom the Council could apply for information, to be given confidentially, as to their knowledge of his habits and conduct in the interval, with especial reference to any addiction to drugs.

Accessory to Manslaughter

JOSEPH CHIMA ENWEZOR, provisionally registered as of 19A Bishop Onyeabo Street, Onitsha, Nigeria, appeared on the charge that he was on 19 May 1966 at the Liverpool Crown Court convicted on indictment of being an accessary before the fact to the manslaughter of Lynn Vickers Smith (date of offence on or about 11 February 1966), and was sentenced to four years' imprisonment.

Mr. G. J. K. WIDGERY (Solicitor to the Council) produced the certificate of conviction. The conviction was admitted by Mr. P. BAYLIS (of Messrs. Hempsons, Solicitors to the Medical Defence Union), appearing on Dr. Enwezor's behalf, and the PRESIDENT announced that the Committee found the conviction proved.

Mr. WIDGERY told the Committee that Dr. Enwezor, who was about 29 years of age, was a Nigerian subject and had a wife and two young children. He had held a post at Warrington General Hospital and while there had become friendly with a nurse, Miss Smith, aged 20. At the end of 1965 the girl had become pregnant and it was not disputed that Dr. Enwezor had been responsible for her condition. On 10 February 1966 Dr. Enwezor had arranged with a friend, Dr. Mohamed, an Egyptian, who was a registrar at Whiston Hospital, Lancashire, that Dr. Mohamed should perform an abortion operation on Miss Smith. This had been arranged without the knowledge of the hospital authorities. The next day Dr. Mohamed had performed the operation on the girl in his bedroom at the hospital. She had become unconscious, the medical staff had been summoned, and strenuous efforts had been made to save her life, but she had died the next day. A few days later Dr. Mohamed had been charged with killing Miss Smith, and Dr. Enwezor had been charged as an accessary and with procuring an abortion. Both had pleaded not guilty, and they had been committed for trial at the Liverpool Crown

Court and allowed bail. However, before the trial was due to take place Dr. Mohamed had committed suicide.

Mr. Widgery said that Dr. Enwezor had appeared at the Liverpool Crown Court in May last year charged with being an accessary to the manslaughter of Miss Smith, procuring an abortion, and supplying instruments for the purposes of the abortion. He had pleaded not guilty, the trial had lasted three days, and he had been convicted on the major charge of being an accessary; the other two charges had not been put to the jury. He had been sentenced to four years' imprisonment and had appealed against conviction and sentence, but the appeal had been dismissed by the Court of Appeal (Criminal Division) on 16 March 1967.

Dr. ENWEZOR told the Committee in evidence that his father was a civil servant in Nigeria and that he was one of a family of eight. Had it not been for these events he had intended to go back to Nigeria to practise. Apart from this offence he had never been in any sort of trouble before. Dr. Enwezor said that he had hoped to marry Nurse Smith. He had been separated from his wife, with very little hope of reconciliation, at the time he had met her. Despite his conviction, he maintained that he would have liked the girl to have had the baby, but she had been determined to end the pregnancy because she was afraid her nursing career would be terminated otherwise. Dr. Enwezor added that he was by religion a Roman Catholic. He had lost his job and his liberty and had disgraced his family. His father, who was responsible for his medical education, was almost heartbroken, and the other members of his family had been greatly upset.

Mr. BAYLIS submitted that this was a most tragic case in which a series of terrible disasters had followed a moment of irresponsibility on Dr. Enwezor's part. The sentence was a severe one and the Committee would not, he thought, have difficulty in imagining Dr. Enwezor's anguish. He urged the Committee to deal with the case as mercifully as it could.

After a consideration *in camera* the PRESIDENT announced that, by reason of the conviction proved against the doctor, the Committee had directed the Registrar to erase Dr. Enwezor's name from the *Register*.

Dr. Enwezor had 28 days within which to lodge an appeal.

Abortion Charges

RODERICK SUTHERLAND ROSS, registered as of 1 Lonsdale Terrace, Edinburgh 3, appeared on the charge that he was on 17 February 1967, at the Edinburgh High Court convicted (after pleading guilty) on charges of procuring the abortion of two women (dates of offences between 1 January and 20 February 1966) and sentenced to four years' imprisonment.

Mr. WIDGERY, Solicitor to the Council, produced the certificate of conviction, which was admitted by Mr. Archibald Bell, Q.C. (instructed by Donald M. McWilliam, Solicitor), appearing on Dr. Ross's behalf. The PRESIDENT announced that the Committee found the conviction proved.

Mr. Widgery told the Committee that some time ago Dr. Ross, who was about 46 years of age, had rented a room in Mayfield Gardens, Edinburgh, apparently for the purpose of playing the bagpipes. Observation had been kept on these premises by the police, and as a result of information thus obtained Dr. Ross had been arrested on 8 August 1966, and later four charges of illegal abortion had been brought against him, covering the period between January and May of 1966. He had been granted bail and the charges had been due to be heard at the Edinburgh High Court on 24 January 1967, but Dr. Ross had failed to appear, his bail had been forfeited, and a warrant had been issued for his arrest, but he had surrendered to the police two days later and had been committed to prison to await the preparation of a fresh indictment. He had then indicated his intention to plead guilty to two charges of illegal abortion and had duly appeared on these charges in February 1967 and had been convicted. The prosecution had not proceeded with the other two charges.

With regard to the charges on which Dr. Ross was convicted, Mr. Widgery stated that the first concerned a young single woman who had consulted her own family doctor, who had confirmed her pregnancy. The girl had not sought advice from him but later had obtained the name and address of Dr. Ross and had got in touch with him, asking him to terminate the pregnancy. He had agreed to do so for a fee of £100. Dr. Ross had given the girl the address of the bed-sitting-room in Mayfield Gardens and had arranged for her to attend there a few days later. She had done so and Dr. Ross had performed an abortion operation on her. This had not been successful and two further attempts had been made over the next week or so, and finally a miscarriage had occurred.

The second charge related to another young woman, a Glasgow student, who had been examined at the outpatients department of the Glasgow Royal Infirmary, where her pregnancy had been confirmed. She had been given certain advice and had also been advised to get in touch with her parents in England. She had been told about the arrangements which would be made for her care and treatment, but she had not taken advantage of this advice and instead had got in touch with Dr. Ross and had gone to see him at his surgery in Edinburgh. She had asked him if he would terminate the pregnancy, and he had agreed to do so for a fee of £100. He had given her the address of his room in Mayfield Gardens. She had gone there later by appointment, and he had performed an abortion operation. In due course the girl had aborted.

Mr. Widgery submitted that these were not therapeutic abortions but cash transactions.

Mr. Widgery added that on 1 March 1961 Dr. Ross had been convicted of driving a motor vehicle when under the influence of drink, for which he had been fined £50 and disqualified from driving for 18 months.

Mr. ARCHIBALD BELL submitted on behalf of Dr. Ross that in both cases another general practitioner of long standing had been consulted. He put in a letter to the Committee from the general practitioner concerned, who stated that he had seen Dr. Ross in January 1966 on two occasions. The letter went on to state why, in both cases, the general practitioner had considered the termination of pregnancy to be justified.

Mr. Bell also put in two references from medical practitioners, a reference from a university professor, and a further reference from a doctor of divinity in the Free Church of Scotland. Dr. Ross came from a professional family: his brother was a solicitor and his father a doctor of divinity. He was in fact not only a fine exponent of the bagpipes but a well-known composer in the piping world.

In reply to a question by the PRESIDENT, Mr. BELL said that the general practitioner consulted by Dr. Ross about the two cases had not given evidence, the reason being that Dr. Ross had pleaded guilty, and on a plea of guilty no evidence was led in a Scottish court in the normal way. Mr. Bell added that Dr. Ross had pleaded guilty on his advice, since he had thought that otherwise the Crown would have added a further charge of absconding, which would have prejudiced a jury.

After a consideration *in camera* the PRESI- announced that, by reason of the conviction proved against the doctor, the Committee had directed the Registrar to erase from the *Register* the name of Roderick Sutherland Ross.

Dr. Ross had 28 days within which to lodge an appeal.

Restoration to the Register

MARK STAINSBY BENTLEY, whose name had been erased from the *Register* in June 1965, made a successful application for restoration of his name to the *Register*.

Infamous Conduct

The last case before the Committee was that of WILLIAM ALBERT PAINE, registered as of Redwater, Alberta, Canada, who was charged that, being registered under the Medical Acts:

(1) On or about 1 December 1965, in connexion with his application for appointment to the medical staff of the Sacred Heart Hospital, McLennan, Alberta, he stated that he held the qualifications "M.Ch., F.R.C.S.(Eng.), F.R.C.S. (Edin.)," whereas he did not hold these qualifications; (2) he permitted the insertion of an advertisement in the *Peace River Record Gazette* of 8 December 1965, and subsequent issues, announcing his commencement in practice in Falher, Alberta, and falsely stating that he held the aforesaid qualifications; (3) having on 4 January 1966, at the Sacred Heart Hospital, McLennan, performed a gastrectomy on a patient, at the conclusion of which a pair of Spencer Wells forceps was left in the patient's abdomen, he subsequently concealed the accident from the authorities of the hospital, and failed to record the fact on the patient's record; and that in relation to the facts alleged he had been guilty of infamous conduct in a professional respect.

Dr. Paine did not appear before the Committee and was not represented.

Mr. HONIGMANN (of Waterhouse & Co., Solicitors) told the Committee that Dr. Paine was resident in Redwater, Alberta, Canada. A Notice of Inquiry had been sent to his registered address in Scotland and also by recorded delivery on 12 June to Dr. Paine in Redwater, which he had acknowledged by signing the notice of delivery slip. Dr. Paine had also written to the Council's solicitors on 22 June stating that he had nothing more to say than he had already said at the inquiry at Edmonton beyond reiterating the fact that he had been acting under the orders of his then employer. "As I have already said, my actions were against my better judgement, but I felt that it was my duty as an assistant to do as I was told. I had been in Canada only about six weeks when the incident occurred, and the advice that I had received up to then was that anything that occurred in the practice was the private business of that practice and was not to be communicated to anyone else, and that included the chief of staff of the hospital. I have not made any arrangements with any lawyer to represent me in London." Mr. Honigmann also read to the Committee the letter sent to Dr. Paine (to which the above was a reply) acquainting him of his position.

The Committee decided to proceed with the case in Dr. Paine's absence.

Facts of the Case

Mr. HONIGMANN told the Committee that Dr. Paine was about 47 years of age and his principal interest appeared to have been in surgical work in hospitals. For a period of about 22 years after qualifying he had worked in a number of different hospitals in Britain. Towards the end of 1965 he had applied for the post of assistant to a Dr. Campbell-Fowler, who had a practice in Falher, Alberta.

Dr. Paine had duly arrived in Edmonton, Alberta, on 23 November 1965, and later that day had gone with Dr. Campbell-Fowler to the College of Physicians and Surgeons in order to enter his name on the medical register for that province. Mr. Honigmann said that as far as he was aware Dr. Paine had given his proper degrees and qualifications to the Registrar.

A few days later he had applied to become a member of the surgical staff of a near-by hospital, the Sacred Heart Hospital, at McLennan. In reply to a question in the application form, "What experience have you in any special branch of medicine?" Dr. Paine had written, "Surgery (M.Ch., F.R.C.S. England, F.R.C.S. Edinburgh)." Dr. Paine, according to the transcript of evidence of the local medical inquiry, had not disputed filling out the form in his own hand. However, his evidence had been that he had filled out two application forms, one of which had contained his true qualifications and no others, and a second one as a joke for Dr. Campbell-Fowler's benefit, and which he thought Dr. Campbell-Fowler had subsequently destroyed. But, according to members of the Credentials Committee, the whole form had been read out in Dr. Paine's presence and Dr. Paine had raised no objection to the inclusion of qualifications he did not possess.

With regard to the advertisements in the *Peace River Record Gazette*, the charge had not been one of advertising as such, for this form of advertising was not a breach of medical etiquette in Canada; the charge had been that Dr. Paine had held himself out as having qualifications which he did not possess. There was some discrepancy in the transcript as to how the advertisement came to be placed, and, according to Dr. Paine's evidence, the first occasion on which he knew these particular qualifications had been inserted was when he had happened to see the advertisement in the newspaper dated 8 December 1965. His evidence had been that he had gone at once to Dr. Campbell-Fowler and and asked him to take steps to see that the qualifications were deleted from subsequent issues and that he had been assured that Dr. Campbell-Fowler would try to see that they were removed. Nevertheless, the advertisement appeared unaltered in two subsequent issues and the Committee might think that Dr. Paine had not done enough in this respect.

Mr. HONIGMANN then put in letters from the Royal College of Surgeons of England and the Royal College of Surgeons of Edinburgh confirming that Dr. Paine was not a Fellow of either College. The transcript showed that Dr. Paine also did not possess the degree of Master of Surgery.

With regard to head (3), Mr. Honigmann said that the operation on the patient concerned in the charge had been a hemigastrectomy. After the operation had been concluded the usual routine check of instruments had shown that a pair of Spencer Wells forceps was missing. The nurses had suspected that the forceps had been accidentally left inside the patient, and an immediate *x*-ray had revealed their suspicions to be correct. The Sister Superior and Administrator of the hospital had informed Dr. Paine by telephone of the accident, and Dr. Paine and Dr. Campbell-Fowler had gone over in order to decide what ought to be done. For a variety of reasons it had been decided not to open up the patient there and then, and one of the reasons had seemed to be that in view of the patient's physical condition it would be better to wait for 8 to 10 days. There was also evidence that Dr. Paine's colleague had been anxious not to bring the incident to the attention of other doctors connected with the hospital with whom there was apparently a certain rivalry.

The patient had seemed to make a normal postoperative recovery, and it had been decided to discharge him on the fourteenth day after the operation. But early in April 1966, after about three months, he had collapsed and Dr. Paine had had him brought back for an emergency operation, when it had been found that a large mass of gangrene had formed through one of the rings on the handle of the forceps. There was some evidence that Dr. Paine had taken care to remove the forceps in such a way that the anaesthetist present had not seen what was being done, as apparently he belonged to the rival group of doctors in the area. There had been complications following the operation, so that eventually the chief of staff of the hospital had had to be brought in for consultation. The patient had eventually made a recovery.

The charge had been concerned not with the accident itself but with the concealment of that accident from the persons in the hospital who ought to have known about it, and from the patient's official record chart. According to the by-laws of the hospital, the incident should have been reported at once to the chief of staff, but it had not been reported for nearly three months. Instead of the fact of the accident being mentioned in the patient's record chart, a wholly misleading report had been written up about the first operation in January, giving the impression that the patient had undergone a fairly simple routine operation with no untoward effects worth mentioning. Dr. Paine's own evidence had been that two reports were written, the false one which had been kept with the hospital records and a true record which he had kept at his own home. The third concealment was that the *x*-ray taken to show that the forceps were still inside the patient had been abstracted from the hospital and kept by Dr. Paine for several months. The fourth was that on the occasion of the second operation, for the removal of the forceps, the hospital records had again been made out falsely in such a way as to omit reference to the removal; and, fifthly, there had been the attempt to prevent the anaesthetist from seeing what was going on.

Mr. Honigmann said that the Committee had no doubt read the relevant parts of the transcript supplied to them of the proceedings of the Disciplinary Committee of the College of Physicians and Surgeons, Province of Alberta, held on 24 August 1966. The PRESIDENT confirmed that this was so. Mr. G. L. HARVEY, Q.C. (the Legal Assessor) said that as Dr. Paine was not present and had no one to defend him he thought it was his duty to draw the Committee's attention to a number of other passages in the transcript which indicated Dr. Paine's point of view. These passages were read out by the Legal Assessor, and after Mr. Honigmann had further addressed it the Committee considered the matter *in camera*.

The PRESIDENT then announced that the Committee had determined that the facts alleged against Dr. Paine in the charge (as amended by the deletion of the word "and" after the word "Alberta" in head (2)) had been proved to their satisfaction.

Mr. HONIGMANN informed the Committee that apart from the incidents mentioned in the charge Dr. Paine had had a perfectly respectable medical career.

After a further consideration *in camera* the PRESIDENT announced that the Committee had judged Dr. Paine to have been guilty of infamous conduct in a professional respect in relation to the facts proved against him in the charge. "These facts were deeply reprehensible," said the President. "The conduct revealed in head (3) of the charge may have had graver consequences for his patient, but, in view of all the circumstances and the fact that he has already been tried and suspended for a period from practice by the College of Physicians and Surgeons of Alberta, the Committee have not directed the Registrar to erase his name from the *Register*. That concludes the case."

B.M.A. Nuffield Library

The library service is available to all members of the Association resident in Great Britain and Northern Ireland (and by special arrangement to members of the Irish Medical Association). A copy of the library rules will be forwarded on application to the Librarian at B.M.A. House.

The following books have been added to the Library:

Kessel, I.: The Essentials of Paediatrics for Nurses, 3rd edition. 1967.

Lewis, G. M. and Wheeler, C. E.: Practical Dermatology, 3rd edition. 1967.

Meeting of Doctors and Clergy

The annual meeting of doctors and clergy, arranged by the Churches' Council of Healing, was held in the Winston Theatre, University Union, Bristol, on 8 July. The subject of discussion was "Religion and Health."

Mr. ROBERT V. COOKE, President-Elect of the British Medical Association, was in the chair. The panel of speakers were the Bishop of Exeter, Dr. Robert Mortimer; Bishop Basil C. Butler, Roman Catholic Bishop of Westminster; Dr. A. M. Maclachlan, former Sheriff of Bristol and a city councillor; and Dr. R. A. Lambourne, psychiatrist and theologian.

Major and Minor Prophets

Dr. MACLACHLAN referred to the days of his youth, when the major prophets of the new faith were H. G. Wells, Bernard Shaw, and Bertrand Russell. One of the minor prophets of the past had said that by the second half of the 20th century hunger and thirst would be unknown, population would greatly increase, war and conflict would be unthinkable, and the world would have become a garden. Dr. Maclachlan said it was something to be young in the early decades of the 20th century, but "now we are old and disillusioned. Hunger and thirst are as prevalent throughout the world as ever. Man is rapacious, deceiving, double-crossing, and as cruel as ever. It was my generation which coined the word 'double speak,' which invented the gas chambers, which devised the political concept of the police state. We have lost that grand vision of the perfectibility of man, but there has been no return to our faith in religion."

Interest in religion remained, said Dr. Maclachlan, but there had been no recapture of the old faith—only a seemingly hopeless searching for something to assuage a great human need. "In our dilemma," he said, "we no longer turn to the parson. He represents organized religion and we have long lost our faith in that." Not every wage earner had a solicitor, a bank manager, an accountant, or considered he had a parson, but everyone had a doctor. So why not go to the doctor with your troubles? He was the one professional man who was readily accessible.

Medicine was the one branch of science which had proved wholly beneficent. The doctor, and especially the family doctor, scientifically up-to-date, yet still the father-figure, the counsellor and friend, had become the priest of the modern world to whom people turned with most of their problems. They were the modern miracle workers.

Dr. Maclachlan said that our Lord spoke of those who had asked for bread and had been given a stone. He asked if that might not be true of many patients who came to see their doctor. With crowded waiting-rooms and more patients than they could adequately deal with, was it surprising that doctors accomplished so little? Was not much of their surgery time taken up with avoiding problems rather than facing them? This was the modern doctor's dilemma.

"Had religion anything to offer in this doctor's dilemma? He could only speak for himself, but one must be prepared to stand up and be counted. For himself, even at its lowest level, he had found religion "philosophically therapeutic." He had always found the arguments against religion formidable but not overwhelming. In the end, said Dr. Maclachlan, it was a matter of faith.

Religion and Purpose

BISHOP BUTLER said that religion's concern with purpose and with final causes was legitimate, if only because purpose was the mainspring of all human behaviour, including the behaviour of scientists. "If you could excise from the scientist his basic desire to know and understand, he would of course cease to practise as a scientist." It was one of the glories of Western medicine that it had become, was already becoming in the days of Galen, a scientific undertaking.

But could scientific medicine proceed without appeal to the notion of purpose or final causes? It might be said that, so far as medicine was scientific, it was concerned solely with the kinds of causality with which physics or chemistry concerned themselves. But, so far as scientific medicine was medical, it was controlled by an overriding purpose of maintaining or restoring health.

The Bishop said that health could hardly be defined in terms which avoided mentioning the well-being of the organism. But well-being was a form of the good, and once the notion of the good was brought into the argument the notion of purpose was admitted. Just as medicine "saved" people from disease, so religion had the notion of a saviour, said the Bishop. There was a deep sympathy of outlook between religion and medicine. The inspiration of both was the good of men. Religion should recognize its debt to medicine, inasmuch as when a person was ill or suffering he was less capable of attending to his spiritual predicament, but, on the other hand, many doctors would agree that very often the underlying cause of their patients' illness was an unresolved spiritual problem, or a "sickness of the soul."

Religion and Disease

The BISHOP OF EXETER asked if there was some specific contribution which Christian religion could make towards health and disease and, if so, what was it? There were two threads to be discerned from the New Testament stories of Christ's healing activities. One was that all disease was somehow or other due to the baneful power of the Evil One; that it was almost contrary to the will of God. The second thread was that of compassion. If God so loved us, then we should also love one another. It was the duty of the strong to help the weak; it was the duty of the healthy to relieve the pain of the sick.

The Bishop said that there was also another tradition in the Bible, which said that disease was not so much something wrought from the Evil One and contrary to the will of God as a visitation or a punishment for sin, or was a testing of a man's faith. That kind of tradition was apparent in the Old Testament. Many illnesses, he said, were a physical expression of a deeper mental or spiritual malaise. But the root of many diseases was excessive anxiety caused by a false scale of values, such as wealth, social status, etc.

To bring any man to the point where he could recognize himself and his condition took time and much preparation. It was especially difficult to accomplish that task when he was not so much demoralized or materialistic as completely unfamiliar with any religious ideas. That was the condition of the great majority of Western civilized communities of the 20th century, and to bring those people to a recognition of their need for mental and spiritual healing was particularly difficult in modern hospital conditions, which lacked quiet and privacy. But the Christian religion did have its specific contribution to make towards the healing of men and women in body and in mind.

Mediator of Social Change

Dr. LAMBOURNE said that those who had hoped to see psychiatry establish itself as a separate discipline, achieving great success after the style of conventional medicine or religion, had been disappointed—providentially disappointed, he believed, since it had made it possible for psychiatry to play its part in a greater success. This had been as a mediator between medicine and religion by revolutionizing both in their understanding of the religious concepts of sin, saving, and salvation. As a result, two disparate views of good and evil, which so often had made discussion and co-operation between the medical profession and the clergy impossible, had given way, over the last 50 years, to a third, shared view.

For now, said Dr. Lambourne, instead of an almost exclusive view of disease as local material badnesses in the flesh, both sin and disease had increasingly come to be seen as joint evidence of a relational disorder within and between man and his environment. That revolution had largely been mediated through psychiatry.

Ladies' Club

The Ladies' Committee, under its Chairman, Mrs. J. Angell James, and with Mrs. Allen Roberts as Secretary, found many very willing helpers among the women doctors and doctors' wives of the Bristol Division, and over 150 took part in the arrangements.

The Ladies' Club within the Union building was planned and organized by the local committee of the Ladies' Guild of the Royal Medical Benevolent Fund, under the chairmanship of Mrs. Herbert Bourns. During the Meeting 523 ladies registered, and those from overseas (38) were made particularly welcome. The spacious lounge afforded a peaceful and friendly atmosphere for tea and coffee. The beautiful flower arrangements throughout the university buildings and in the cathedral were widely admired.

Bristol's sunshine, though welcome, may have made the well-attended shows of autumn fashions somewhat unrealistic. Large parties visited Badminton House, where the Duchess of Beaufort received the guests; Athelhampton, the home of Mr. Robert G. Cooke, M.P.; Clevedon Court; and Longleat. Two well-supported visits were made to Berkeley Castle and to the Severn Wildfowl Trust at Slimbridge. Those who so obviously enjoyed the excursions to Bath, Wells, and Glastonbury greatly appreciated the generous hospitality given by local ladies, which was a feature of other shorter outings.

Annual Dinner

The Annual Dinner of the British Medical Association was held at the Grand Hotel, Bristol, on 11 July.

Among the many distinguished guests received by the President (Mr. ROBERT V. COOKE) were the Duke and Duchess of Beaufort; the Lord Mayor of Bristol, Alderman the Rev. F. C. Vyvyan-Jones, and Mrs. Vyvyan-Jones; the Sheriff of Bristol, Mr. K. Lalonde, and Mrs. Lalonde; the Bishop of Bristol, the Rt. Rev. O. S. Tomkins, and Mrs. Tomkins; the Rt. Rev. J. E. Rudderham, Bishop of Clifton; the Vice-Chancellor of the University of Bristol, Professor J. E. Harris, and Mrs. Harris; Mr. C. O. F. Rieger and Mrs. Rieger; the Dean of Bristol, the Very Rev. Douglas Harrison, and Mrs. Harrison; General Sir Robert Drew; the Chief Constable of Bristol, Mr. George Twist, and Mrs. Twist; Alderman Cyril Hebblethwaite; Colonel Sir Denys Hicks and Lady Hicks; Professor J. S. Heller and Mrs. Heller; Professor C. F. Powell and Mrs. Powell; and Professor T. F. Hewer and Mrs. Hewer.

"City and County of Bristol"

Proposing the toast "The City and County of Bristol," Lord COHEN OF BIRKENHEAD, President of the General Medical Council, said it was quite natural that a city, the nucleus of which was founded where the Frome and the Avon ran together, should be a great port of commerce and a port from which many explorers left to discover new lands. Among those were two who had a special interest for medicine—John and Sebastian Cabot. Lord Cohen said that members of his generation would remember Richard Cabot's differential diagnosis. He was a descendant of the Cabots who left Bristol and landed in America, where they instilled that spirit of ethical superiority which characterized Balliol, which characterized Bristol, and which now characterized Harvard.

Bristol was a city of "firsts," continued Lord Cohen. It was the first city to have a free library; it was the first city to publish a newspaper outside London; it was the first city to have a savings bank; and it was the first city from which a steamship, the *Great Western*, sailed. Many great names were associated with Bristol, and of those connected with medicine the first must be William Budd, the greatest epidemiologist of his age. Then there were James Pritchard and John Addington Simmonds, the great progenitor of the medical school and university.

The University of Bristol was one of the most vigorous schools of teaching and research in this country, and was the envy of many universities throughout the country. Coupled with the toast was the name of the Lord Mayor. He was the first ordained priest to occupy the mayoralty, concluded Lord Cohen.

The LORD MAYOR congratulated Lord Cohen on the honour which had been conferred upon him by his colleagues, and congratulated the British Medical Association on being able to assemble in person four holders of the Association's Gold Medal out of a total of nine.

The Lord Mayor applauded the wisdom of the Association for electing Mr. Robert Cooke to the high office of President. It was the fourth occasion on which the B.M.A. had visited Bristol, and Bristol hoped that it would not be another 73 years before it came again.

"British Medical Association"

The DUKE OF BEAUFORT proposed the toast "The British Medical Association." He said that the B.M.A. had frequently been described as the doctors' Parliament, and, if so, it was a very remarkable one. The Medical Act of 1858 was almost entirely the work of the Association, and if it was a doctors' charter it could reasonably have been said to be no less a patients' charter as well. Since 1858 the Associaton had fought long, hard, and successfully for an improvement in the conditions of the medical service in poor law hospitals, the armed Forces, schools, and hospitals.

When the meeting of the Association was held in Bristol in 1863, the dinner was held in the Victoria Rooms. The *British Medical Journal* rather crushingly remarked at the time that the gallery was occupied by a number of ladies. They were not to be permitted to become members of the Association until 1892, in spite of the fact that Dr. Elizabeth Blackwell of Bristol registered in 1858. The speeches at that dinner in summary form occupied some 7,000 words in the *B.M.J.* "You organize things a bit better today," concluded his Grace.

The PRESIDENT, in response, said that the contribution made by the Duke and the Duchess to the life of Bristol and the whole of the west country was well known.

On behalf of the Association the President thanked many people who had contributed to the success of the meeting in Bristol.

"The Guests"

The toast of "The Guests" was proposed by the Chairman of Council, Dr. RONALD GIBSON, who extended a particularly warm welcome to the ladies.

The Vice-Chancellor of the University of Bristol, Professor J. F. HARRIS, responded.

Association Notices

Sutton Coldfield Division: Change of Name

The Council hereby gives notice that the name of the Sutton Coldfield Division has been changed to the Sutton Coldfield, Lichfield, and Tamworth Division.

Election of Members of Scottish Council

Notice is hereby given that nominations for the election of three members of the Scottish Council by public health service members in Scotland must be forwarded in writing to reach the Scottish Secretary, 7 Drumsheugh Gardens, Edinburgh 3, not later than Saturday, 26 August, 1967. In accordance with the Schedule to the By-laws, as amended by the A.R.M., 1967, two of the three members elected by the public health service members in Scotland must be departmental medical officers. Candidates must be members of the Association.

Nominations must be on the prescribed form, copies of which can be obtained on application to the Scottish Secretary. Nominations may be by a regional public health committee in Scotland or by a public health service member.

If a contest occurs voting papers containing the names of duly nominated candidates will be issued by the Scottish Office, British Medical Association, to each public health service member in Scotland.

DEREK STEVENSON, *Secretary*.

Ballot on Special Distinction Awards for Consultants

The British Medical Association is conducting a postal ballot of all consultants and senior hospital staff and senior registrars to ascertain their views in respect of merit awards for consultants. Ballot papers were sent in June to consultants, S.H.M.O.s, and senior registrars in the United Kingdom, together with a covering letter, a memorandum of information, and a business-reply envelope. Any consultant, S.H.M.O., or senior registrar who has not received these papers and who wishes to participate in the ballot should inform the Secretary of the Association, B.M.A. House, Tavistock Square, London W.C.1.

Diary of Central Meetings

AUGUST

23 Wed. Hospital Junior Staffs Group Executive Committee, 2 p.m.

Branch and Division Meetings to be Held

Members proposing to attend meetings marked ● are asked to notify in advance the honorary secretary concerned.

FURNESS DIVISION.—At Duke of Edinburgh Hotel, Monday, 31 July, 8 p.m., annual general meeting.

Correction

In the report of the Annual Representative Meeting (*Supplement*, 22 July, p. 88) Air Marshal Sir Richard Nelson was wrongly described as D.G.M.S., Royal Air Force. Air Marshal Sir George Gunn succeeded Sir Richard Nelson as D.G.M.S. in January 1967.

General Medical Services Committee (Scotland)

The General Medical Services Committee (Scotland) held its first meeting of the new session in Edinburgh on 29 June.

Dr. A. A. Clark was re-elected Chairman, and Dr. J. E. Miller Vice-Chairman.

The CHAIRMAN welcomed the following new members: Drs. A. D. Mitchell, W. M. Paterson, Elizabeth Rose, H. A. Stewart, and J. S. Scobbie.

Dr. J. CORMACK said he was somewhat unhappy about the procedure for appointing the young practitioner member to the Committee. He thought that it did not necessarily give him the full democratic backing of those he represented. He suggested that all young practitioners in Scotland should be circularized and asked for nominations. The Committee could still have the final say in the appointment. Dr. C. D. FALCONER, Assistant Scottish Secretary, explained that the list of young practitioners in Scotland was compiled yearly. The new list would be available at the next meeting of the Committee, and consideration could then be given to holding an election in the way suggested by Dr. Cormack.

General Practitioners in Hospital

Dr. C. J. SWANSON, chairman of the working party on general practitioners in the hospital service, reported on the outcome of a meeting with the Joint Consultants Committee (Scotland). The Committee resolved that representations should be made to the Scottish Home and Health Department in support of Dr. Swanson's proposals, which included more adequate security of tenure of appointments and additional pay for "specialist responsibility" in 10(*b*) appointments.

It was agreed to keep the working party in being to make the representations.

General Practice Finance Corporation

The Committee considered a letter from the Scottish Home and Health Department about the General Practice Finance Corporation. The Department stated that it would be prepared to confer powers on the Finance Corporation to provide loans to doctors for purchasing equipment only if it could be shown that doctors were having difficulty in borrowing money for this purpose.

Dr. E. V. KUENSSBERG was dissatisfied with what the Department said and wished it to reconsider its policy as a matter of urgency. The Finance Corporation should be able to make loans available for the equipment which was so essential for the practice of modern medicine. The Committee agreed to ask that this point should be taken up by the General Medical Services Committee in London and direct with the Finance Corporation.

Subcommittee Reports

The Committee was informed that the Chairman's Subcommittee had asked the Department on 31 May to circularize the *Report on Dental Anaesthesia* (S.O. Code No. 32-536) to all general practitioners, as had been done in England and Wales.

The report of the Ad Hoc Subcommittee on the Administration of Health Centres was received, and the Secretary was instructed by the Committee to forward copies to the Scottish Home and Health Department, the Central Consultants and Specialists Committee, and the Public Health Committee (Scotland) for further discussion.

Dr. G. WATT said that the administration of his own new health centre, which was about to be opened at Langholm, would have to be considered without delay.

The report of a subcommittee of the Standing Medical Advisory Committee on Hospital Medical Records in Scotland was also received. Dr. W. W. FULTON pointed out that the recommended size of the hospital outpatient referral forms did not conform to the "post-office preferred" dimensions, and the Committee instructed the Secretary to make urgent representations to the Department on this matter.

Maternity Medical Services

A memorandum was received from the Stirling and Clackmannan Local Medical Committee proposing a fixed fee for "combined care" services. The memorandum stated that under the scheme antenatal care was carried out by the general practitioner and the patient was booked into hospital for delivery. The patient entered hospital in labour and was discharged by the obstetrician to the care of the general practitioner, who attended to her in the normal way and carried out the postnatal examination at or about the sixth postpartum week. The suggested fees for this service were as follows: (1) for full antenatal services £8 15s.; (2) for two visits after confinement £1 5s., and for three visits after confinement £1 17s. 6d.; and (3) for a final pelvic examination at six weeks £1 5s. That would give an average fee for the service of £11 11s.

The memorandum stated that the fees for maternity services, as indeed for all other services, often bore little relationship to the time, thought, and care that might have been expended on the individual case, and could "average" out only over all the cases—the easy and the difficult.

Dr. FALCONER reported that the Scottish Home and Health Department had agreed this arrangement together with the fee of eleven guineas.

Health Centres

The CHAIRMAN reported on the outcome of discussions with the Secretary of State for Scotland about the allocation of funds for the building of health centres.

The Committee was greatly disappointed that the Secretary of State had been unable to give a more hopeful prognosis about the amount of money that would be allocated for this purpose. It was thought that no time should be lost in letting members of Parliament know that if health centres were to be built in their constituencies then much more money would be required.

Proposals for new health centres at Golspie, Thurso, and at Bonnyrigg were approved. In each case the Secretary of State had been asked to delegate powers to the local authority, and, in deference to the wishes of the local doctors, the Committee agreed. However, the Committee wished to point out to the Department that what it saw for the future were health centres as defined in Section 15 of the N.H.S. (Scotland) Act, 1947, rather than the renting of space within a local authority building.

Section 15 of the Act states that the Secretary of State should provide, equip, and maintain health centres.

Other Matters

A syllabus was received from Edinburgh College of Commerce which detailed a course for medical secretaries, starting in September and lasting for 18 months. The four-term course would lead to the diploma of the Association of Medical Secretaries. Correspondence courses were already under way in Glasgow.

The Committee was informed that Professor A. Mair, of the Department of Public Health and Social Medicine at Queen's College, Dundee, had succeeded Dr. H. Miller as Medical Adviser to the Ministry of Labour in Scotland. Members of the committee emphasized the special need for the holder of this appointment to be well versed in general practice.

Stirling and Clackmannan Local Medical Committee proposed that the Committee should ask the Department to introduce a computer for cervical cytology records and for notifying executive councils about the payment due to the doctor.

The Committee agreed to make representations to the Department.

It was reported that the Secretary of State for Scotland intended to establish a new health education unit within the Scottish Department which would be responsible for stimulating health education in Scotland. This unit would work in close association with the Scottish Council for Health Education.

The Committee thought that this development was closely connected with general practice, and asked for further information on the matter from the Department.

Telephones for Hospital Staff

The joint first report of the negotiations between the Ministry of Health and representatives of hospital medical and dental staff (*Supplement*, 27 May, p. 135) stated that telephone expenses of hospital staff had been one of the matters considered in the discussions.

A memorandum recently issued to hospital boards and management committees by the Health Departments (H.M. (67) 44: S.H.M. 42/1967) sets out the revised conditions for the payment of the cost of installation and the rental of telephones in the residences of hospital staff. In future boards and committees will pay the cost of installation and rental of a telephone for a hospital doctor, provided that (1) it is essential for the efficiency of the hospital service that he should be on call outside normal working hours; (2) the telephone is the only practicable way of communicating with him; and (3) his salary does not exceed £2,050 a year.

Boards and committees will pay the cost of installation and rental of an extension from the hospital to a doctor's residence, provided the telephone is the only practicable way of communicating with him and that his home is within or adjacent to the hospital curtilage.

All staff, including those using telephones provided at their own expense, will be able to claim the cost of outgoing calls made on official business.

Hospitality

A German doctor living in Karlstadt (Northern Bavaria) would like his 19-year-old son to stay with a British medical family for two to three weeks in August as a paying guest or on an exchange basis.

A Swedish girl who is the sister of a doctor and is at present living in London would like to stay *au pair* with a medical family until Christmas, starting as soon as possible.

Would anyone who is interested please get in touch with Dr. R. A. Pallister, Medical Director, International Medical Advisory Bureau, B.M.A. House, Tavistock Square, London W.C.1.

H.M. Forces

A *Supplement* to the *London Gazette* has announced the following awards:

Army Emergency Reserve Decoration.—Colonel H. S. Davis, Q.H.P., and Major T. B. Boulton, R.A.M.C.

First Clasp to the Territorial Efficiency Decoration.—Major H. Bloom, R.A.M.C., retired.

Territorial Efficiency Decoration.—Majors J. S. G. Blair, H. Bloom, retired, J. Humphreys, C. H. Jones, T. A. Piggot, I. C. Roddie, and P. J. W. Rowell, R.A.M.C.

Appointments.—Group Captain J. P. Sewell (ear, nose, and throat duties, R.A.F. Hospital Wegberg, Germany); Group Captain R. Mortimer (pathological duties, Institute of Pathology and Tropical Medicine, R.A.F. Hospital, Halton, Bucks); Group Captain F. D. Campbell (to command, R.A.F. Hospital, Uxbridge); Wing Commander F. C. Hurrell (to the Directorate-General of R.A.F. Medical Services, Ministry of Defence); Wing Commander D. M. Fanning, O.B.E. (acting principal medical officer, Headquarters, Coastal Command); Wing Commander F. R. Jones (pathological duties, R.A.F. Hospital Wegberg); Wing Commander R. A. Riseley-Prichard (senior medical officer, R.A.F. Khormaksar, Air Forces Middle East); Wing Commander J. L. Facer (senior medical officer, R.A.F. Tengah, Singapore).

ROYAL NAVY

Surgeon Commanders G. A. Binnes, R. S. McDonald, and J. M. Hanson to be Surgeon Captains.

Surgeon Lieutenant-Commanders T. P. Oliver, L. C. Banks, T. R. W. Hampton, D. C. Beckingham, T. L. Fallowfield, and D. M. Ackery to be Surgeon Commanders.

ROYAL NAVAL RESERVE

Surgeon Captain C. E. Shafto, V.R.D., has been placed on the Retired List.

Surgeon Commander D. B. Moffatt, V.R.D., to be Surgeon Captain.

Surgeon Commander H. D. Doyle has been placed on the Retired List.

Surgeon Lieutenant-Commanders J. J. McMullan, R.D., and R. J. Howd to be Surgeon Commanders.

Surgeon Lieutenant-Commander R. W. Bazeley has been removed from the Active List.

Surgeon Lieutenant-Commanders R. A. J. Baily and G. L. Bolt have been placed on the Retired List.

Surgeon Lieutenants J. R. Newstead and B. C. Wyatt to be Surgeon Lieutenant-Commanders.

ARMY

Brigadier E. H. P. Lassen, D.S.O., late R.A.M.C., has been appointed Honorary Physician to the Queen, in succession to Major-General W. B. F. Brennan, C.B., retired.

Colonel C. S. Nicol, T.D., R.A.M.C., T. and A.V.R., has been appointed Honorary Physician to the Queen, in succession to Colonel J. W. A. Crabtree, O.B.E., T.D., tenure expired.

Colonel S. Curwen, T.D., R.A.M.C., T. and A.V.R., has been appointed Honorary Surgeon to the Queen, in succession to Colonel B. B. Hickey, T.D., tenure expired.

General Medical Services Committee

The General Medical Services Committee spent a long time examining the ills of general practice. Many thought that these were largely self-induced, and some feared they might be mortal. One older member declared that all his working life he had heard it said that general practice was going to the dogs. But, he said, it was done well and would continue to be done well. Other speakers, however, were less confident. The majority saw an urgent need for treatment and for the eradication of the basic causes of the disease. The Committee tried to define these and to prescribe the appropriate therapy. A small working party is to put together in a report the various opinions expressed, and it will present this in due course to the Committee for approval.

In a discussion on the "Asset" case, Dr. Speakman posed the question: Who is a general practitioner in contract with?

A meeting of the General Medical Services Committee was held on 27 July. Dr. J. C. CAMERON was in the chair.

Annual Conference

Dr. W. HEDGCOCK (Secretary of the Committee) reported that complaints had been received from some local medical committees that the Annual Conference of Representatives of Local Medical Committees (*Supplement*, 24 June, p. 177) had been unable to finish its business.

Dr. R. B. L. RIDGE (Chairman of the Conference) said that the responsibility for the Conference running out of time had lain with the speakers. For instance, they had been asked not to repeat remarks or to read written speeches when it was clear that the meeting was behind the motion. Dr. R. A. KEABLE-ELLIOTT said that many small points which had been brought up at the Conference could have been answered beforehand if there had been a preliminary inquiry, and a lot of the motions could have been referred direct to the G.M.S. Committee. Dr. B. L. ALEXANDER agreed that the problem had arisen because of the repetition of speeches. Late amendments had also contributed to the difficulties. He wondered whether the Agenda Committee should be given power to reject late amendments, unless they were urgent. Possibly there should be a limit to the number of motions that a local medical committee could put forward. Dr. Alexander thought that steps should be taken to bring some order to the Conference agenda, because the chairman was not now in a position to reject amendments on the day of the meeting.

Dr. A. J. ROWE said that both the Conference and the Annual Representative Meeting were in the same plight. Both bodies would have to be more firm in future in deciding what business should be debated. He believed that the Conference should direct itself to general policy and not to details, which could be referred to the G.M.S. Committee. Dr. A. SPEAKMAN said he hoped that if any local medical committee objected to its motions being referred to the G.M.S. Committee its objection would be upheld. The Conference was the local medical committees' chance to give their point of view and to hear that of others. It should not be assumed that any motions not dealt with should automatically be referred to the G.M.S. Committee.

Changes Delayed

Dr. A. ELLIOTT said that the Constitution Subcommittee had been aware of the situation, and had decided to introduce certain changes, including changes in the standing orders of the Conference. Unfortunately, those changes had not yet been made, and until they were the situation would not improve. The Agenda Committee should be asked to consider this early next year, because of its importance. He hoped that, in consultation with local medical committees, the Agenda Committee would think also of other ways to facilitate the business of the Conference.

Dr. F. E. GOULD thought that the hand of the Agenda Committee needed strengthening. Its job should be to make up an agenda, not to accept everything that local medical committees sent in. The Committee should be able to send motions back to local medical committees with comments and suggestions. Dr. JOAN CHAPPELL suggested that when the Chairman of the G.M.S. Committee was prepared to accept a motion he should say so immediately after it had been moved. That might save time.

The CHAIRMAN said that both the Conference and the Annual Representative Meeting had been important occasions, because they were the first opportunity general practitioners had had of discussing the results of the new system of remuneration. It was true that many of the Conference motions could have been accepted without debate, but he thought it was important that local medical committees should be allowed to put forward their points of view. He had looked at the record of the proceedings of the Conference, and he did not think that there had been superfluous debate on many points. Representatives had put their points succinctly. If there had been many A motions local medical committees might have complained that discussion was being stifled. Likewise it would have been entirely wrong to have given the A.R.M. the impression that its business was being rushed because the decisions had already been taken in the Conference.

Dr. T. K. COOKE agreed that discussion should not be stifled. Speeches at the Conference had been limited first to three, then to two, and finally to one minute, and it had become a farce. If agendas continued to be long both the A.R.M. and the Conference should be extended a day.

Dr. I. M. JONES insisted that criticism should not be directed at the Chairman of the Conference. He said he believed that conferences of this kind served two main functions. Firstly, they were a forum for determining views on major issues of principle, and, secondly, they served a public relations function. The Annual Representative Meeting was open to the lay press. The proceedings of the Conference of Representatives of Local Medical Committees were reported in the *British Medical Journal*, and it was a public relations exercise between the G.M.S. Committee and general practitioners. Dr. Jones said that the Committee now had to think in terms of next year's Conference. He thought the Committee might appeal to local medical committees to bear in mind what he had suggested were the functions of the Conference, and to accept that the Conference agenda was not the proper place for matters of detail.

Logical but Undemocratic

Dr. C. J. SWANSON agreed that what Dr. Jones had said was logical but it was not democratic. He believed in the right of every local medical committee to put forward a motion if it wanted to and expect it to be put on the agenda. What was a detail to the G.M.S. Committee might be most important to a local medical committee. If extra time was needed it would have to be given. There should be no attempt to stifle debate.

The CHAIRMAN, in reply to a question, said he intended to ask that rural practice matters should be taken earlier in the agenda of the next Conference.

Dr. RIDGE, replying to the debate, said that the Conference was a most important instrument of democracy. "Without the Conference and the answerability to it of this Committee the system becomes an autocracy and a dictatorship. . . . I am certain that there must be no restriction either on the submission of motions or on the amount of speech." However, Dr. Ridge continued, it should be remembered that there were different ways in which these freedoms could be used. There could be injudicious use of both agenda space and speaking time. It was in these respects that the solution to the problem lay in the hands of the local medical committees and their representatives.

At the end of the first day of this year's two-day Conference the mid-point of the agenda had been reached. Provided that everybody paid reasonable regard to economy in time the job could be done in the time. On the second day the Conference had got behind time, and Dr. Ridge attributed that to the fact that it had come to items which required longer examination. There was the public relations aspect, said Dr. Ridge. It was important that those who had the power to make decisions in the N.H.S. should know what the doctors thought.

Compensation for Rural Doctors

The Committee considered a recommendation of the Rural Practices Subcommittee that representations should be made to the Ministry of Health that doctors practising in scattered rural areas should receive some form of compensation for being unable to join a group practice and thus get the extra pay available to doctors in group practices.

Dr. SPEAKMAN suggested that urban doctors should be included. For various reasons it was not always possible for them to form group practices.

Dr. J. S. HAPPEL, Chairman of the Rural Practices Subcommittee, said that the point was that in some areas it was impossible to form groups. When urban doctors found themselves in the same position the subcommittee would support them, but it was quite a different position when general practitioners did not wish to form groups.

The Committee adopted the recommendation.

Recruitment to General Practice

The Committee proceeded to debate memoranda by Dr. Hedgcock and Dr. Alan Gilmour (Assistant Secretary) on the shortage of family doctors.

Dr. Hedgcock's memorandum stated that the reason for the shortage could not be pinpointed. There were many factors outside pay and workload, important as those were. The departure of established general practitioners was not balanced by the entry of young doctors.

Dr. Hedgcock thought that the main reason why young doctors did not enter general practice was that they were discouraged by what they heard and by what they saw and experienced. They might have also heard unhappy experiences of some of their contemporaries.

Dr. Hedgcock went on to state in his memorandum that it was wrong that young doctors should have been allowed to get into bad situations. It was a waste of their training. Yet the tragedy was that they did not know, and did not believe, that the great majority of practices in this country were now of the type that they would have liked and which they believed could be found only overseas. General practitioners must now be willing to show young doctors that family doctoring could be a fine career, if only there were enough of them. They must also actively try to ensure that young doctors were guided to the sort of practices that they wanted, and that these practices had in fact got what they wanted. Unless family doctors themselves did this—and quickly—they must soon expect to see general practice disappear, and a great deal of the blame for that would be theirs.

There should be, the memorandum stated, a carefully organized service guiding young doctors to sound practices as a sequel to sound vocational training. There should be a well-planned, long-term publicity campaign to show medical students and young doctors what good general practice was and how they would be helped to enter it. That could be done only by family doctors themselves through the G.M.S. Committee.

Profession's Responsibility

Dr. HEDGCOCK, speaking to his memorandum, said that the responsibility for the future of general practice lay with the profession. It might be argued that, since there were some 20,000 general practitioners and they were decreasing at the rate of 300 a year, there was not very much to worry about yet. But if the drop in numbers in certain areas went on the system would soon crack.

Dr. Hedgcock said he had analysed the reasons why young doctors did not enter general practice, and he had picked on two: they did not like the way they had to practise, and they did not like the way they were paid. The young men were also being discouraged by doctors themselves. Doctors told their sons and their son's friends that general practice was not the occupation for well-trained scientific doctors.

Dr. Hedgcock said that it was a very long-term problem. He suggested that the idea of going into general practice should be put into the minds of young doctors at an early stage in their training. Referring to internal publicity, he suggested that articles could be commissioned for medical school magazines on various aspects of family doctoring. The possibility of providing lectures and films could also be considered. Possibly one number of G.M.S. *Voice* in the near future should be sent to all hospital junior staff, because many of them would become general practitioners. Articles, lectures, and films could be followed up by appropriate career leaflets prepared by the B.M.A.'s "Career Service." To encourage some of the best young doctors to enter general practice, Dr. Hedgcock suggested that the Claire Wand Fund should offer a few general practice fellowships each year. These should be highly competitive awards to recently fully-registered doctors, providing funds over three years to assist in training for general practice.

"Placing" Service

Dr. GILMOUR, introducing his memorandum on a "placing service" in general practice, said that there was a tendency for young doctors to drift into a vacancy, and hope that it would suit them, instead of there being some organized system which would assist them to go into practices where their ability and temperament would be best expressed. Whatever the outcome of the deliberations of the Vocational Training Subcommittee and similar groups, there was likely to be a longer period of vocational training developed for general practice and even more need for the doctor to have a career pattern.

Dr. Gilmour suggested that the G.M.S. Committee should provide a placing service as a necessary and practical corollary to its campaign to encourage entry into practice. The service would have to be co-ordinated on a national basis. The service should look for applicants of above average aptitude before finding them "pullman-class" practice vacancies. The assessment of practices was likely to meet with some opposition, said Dr. Gilmour, but rather less so in a seller's market. The assessment should be done by medical men. Local medical committees might be too local to make, or to appear to make, an objective assessment. There was likely to be much resentment in some quarters at any assessment being made at all, and any committee which was formed should be widely representative and as nearly acceptable as possible to the profession as a whole. It might be a committee covering a hospital board region and consisting of nominees of local medical committees, of the faculty of the Royal College of General Practitioners, and of local postgraduate medical personnel.

General Debate

Dr. GOULD said he believed that the function of the G.M.S. Committee was to look after the interests of doctors in the N.H.S., to try to improve the Service, and to make it a suitable one for general practitioners. But they were being shot at in their own family. Dr. Gould referred to a heading in a daily newspaper, "Move to woo doctors

World Problem

Dr. A. ELLIOTT reminded the Committee that there was a shortage of general practitioners all over the world. Young men could not be expected to go into general practice when the established doctors were not sure of their position. Many of the best British doctors were trying desperately to get into the hospital service, and of the remainder those who did not emigrate found themselves in general practice. The standard of those applying for general practice vacancies was not high. He knew of a practice in an urban area on the outskirts of London where it was a question of either appointing a doctor with no experience or of appointing no one.

Dr. Elliott said he preferred the term " community doctor " to general practitioner. The family doctor of the past—the horse-and-buggy doctor who knew all there was to know about medicine—would go. Specialization was increasing, and to secure his status a general practitioner must have vocational training in the same way as his specialist hospital colleagues. General practitioners could not sustain their demands for better pay and a career structure if they did not take courses of specialist training equivalent to those taken by hospital doctors. The first step must be to educate the teachers. There should be departments of general practice in the universities so that students could see that general practice was a " dignified section of the profession."

Dr. A. J. ROWE agreed that recruitment of doctors to general practice was a world problem. " But," he said, " we want to look a little nearer our own shores—to Europe." Certain countries had been through the acute stage, and they had attempted remedies. Their experiences must be taken into consideration.

In one country in Europe which had a postgraduate diploma and a master's degree in general practice the relationship between general practitioners and their consulting colleagues was clear. There was no denigration of general practice. Attempts had been made to give some sort of definition to the specialty of general practice. Dr. Rowe agreed that there was need for a group to study the position of general practice in Britain, but it was not a matter which could be dealt with quickly.

Praise for General Practice

Dr. H. N. ROSE said that he had been in general practice for over 40 years, and if he had his time over again he would still be a general practitioner. But, having said that, he would consider why doctors preferred to go into the hospital service. Nowadays young men in hospital got enough to live on. There was not the economic necessity to go into general practice. All his working life it had been said that general practice was going to the dogs—more so since the Health Service. People were always studying what was wrong with general practice—there had been the Cohen report and the Gillie report—but there were never inquiries into consultant practice. General practice was a worth while job. It was done well in this country and would continue to be done well. Students must be told that the system of remuneration had been altered and that the work load was being eased gradually by appointment systems, by ancillary help, by rotas, and by emergency services. General practice was not as bad as some people made out, said Dr. Rose.

Dr. B. D. MORGAN WILLIAMS said that it was the teachers who had to be taught, otherwise they would give the wrong impression to young men at their most impressionable age. Teaching-hospital consultants saw only the worst side of general practice; they did not see the successes. They often did not see the work of the good general practitioners who did their best to keep patients out of hospital. Papers were written by hospital doctors. One had suggested that patients should be seen by a " general physician." Unfortunately, sociologists took notice of this and so did the Ministry, because they were not aware of what was going on in general practice, and, worse still, they did not seem to want to know.

Dr. Morgan Williams said that before the war and up to 1948 morale in general practice had been high. After the war, about 1948, morale began to go down. " I suggest that this is due to poor feed-back and poor administration. I maintain that this fall in morale has been almost entirely due to sheer blind ignorance on the part of the administrators of the Health Service. . . . It is time that not only the profession but the whole country was woken up to the fact that morale in general practice is at its lowest because the Ministry doesn't want to know."

Dr. J. L. MCCALLUM hoped that the Committee would make it known that it was taking the lead in reforming general practice. He said that the biggest evil had been the division of doctors into three groups since the start of the Health Service. Now was the time for general practitioners to say that that was wrong. Dr. McCallum said that he believed students went into medical school too early. " There is no doubt in my mind," he said, " that over the years the doctor has become a less educated person. He has tended to become too specialized too early. When he comes out into general practice . . . he is not interested enough in what the patient is doing and how to fit medicine round him. The consultant is in a worse position, because he never leaves the hospital confines." Like other speakers, Dr. McCallum wanted medical students to see what went on in general practice, because otherwise they had no idea of either the fun or the difficulties. Despite the prospective increase in the number of medical students general practice would find it difficult enough to compete for recruits.

Dr. G. W. HOUSTON commented on the extreme rapidity of the advances in medical and scientific knowledge in the past 20 years. " We have to decide the direction in which general practice is to go. There are two main lines of thought. One is the community care concept. I suggest that this is wrong, and that the manner in which general practitioners are trained for this concept is wrong. General practice is a specialized environment. I would like to see a far greater development of the concept of group practice. We have to chase after a certain amount of specialized knowledge, so doctors must group together, with each doctor having a particular interest and taking a detailed postgraduate course in his own subject. The practice as a group will then be in a far greater position to deal with the medical problems that arise within the community."

Dr. A. D. MITCHELL reminded the Committee that the teachers to whom much of the vocational training for general practice was entrusted had had little or no experience of general practice. General practice was a specialty, and it was as important for senior registrars and consultants to go out into general practice as it was for the reverse to happen.

Unattractive Areas

Dr. C. J. WELLS said that recriminations between the various branches of the profession would not serve to help. He paraphrased the titles of the memoranda which had been presented as " How to place not enough young family doctors in an attractive career in unattractive areas." That might sound amusing, he said, but that was what the Committee was talking about. It was discussing how to attract young doctors into the heavy industrial areas, where the standard of living and the morale of the population were low. For that reason the people tended more than in other areas to go to the person whom they thought could help them for the least financial outlay. The result was that the morale of the general practitioner was also low.

Dr. Wells suggested that the time for talk was over. The profession, perhaps the Committee, had got to finance general practice. If the profession did not do this nobody else would. The Government had failed to offer any inducement to doctors to go into the heavy industrial areas. The time had come, he said, when general practitioners should go to the aid of their colleagues in these areas, even to the extent of providing them with some financial assistance.

Dr. D. E. HEATH thought that the lack of doctors and poor doctoring arose from undue demand by patients. The Minister must face up to the problem of patient-demand and be asked to experiment with a five-year trial of item-of-service payments by the patients.

Dr. RIDGE recalled that many of the points that had been made by the Committee had been published in the Gillie Report, and he quoted from that report. There was only one aspect of the practice of medicine in general practice, continued Dr. Ridge, which demanded the concept of general practice, and that was the personal approach of the patients to the doctor. Anything else in general practice could be done equally well under some other arrangement. But only the general practitioner, with his own place for patients to come to and the facility to visit the patients in their own homes, could provide that personal contact. It was what the people wanted.

The Gillie Report had stated: " The real incentive to good general practice is and can only be the professional conscience and sense of vocation of the doctor himself. Without this, other incentives are vain." That, said Dr. Ridge, must underlie any approach made to the problem of not enough young family doctors. " I suggest that as well as talking about vocational training we should set up some machinery to provide vocational guidance. . . . With our knowledge of general practice and our belief of what the essence of general practice really is, surely we are in a position to help young men to decide whether they are the right type of person to go into general practice." Vocational guidance could be combined with a placing service.

Dr. Hedgcock, replying to the debate, said that the trustees of the Claire Wand Fund had underwritten, subject to what the G.M.S. Committee decided, the idea of awarding fellowships in general practice to try to encourage the right type of young doctor to enter general practice. That did not necessarily mean the best academic young doctor.

Dr. Ridge had put forward an excellent idea about vocational guidance. This had already started in the B.M.A.'s new " Careers Service." Referring to the placing service, Dr. Hedgcock said he preferred to use the word guidance. Guidance should be available on vocation and on placing, and if the Committee agreed with the Claire Wand Fund proposals that could be included in the remit.

The Committee agreed that the proposals that had emerged from the debate should be set out in detail by a small working party and presented in due course to the Committee for final approval.

Other Items on Agenda

Model Assistantship Agreement

A model assistantship agreement, which had been discussed by the Assistants and Young Practitioners Subcommittee, was considered by the Committee.

Dr. M. A. Wilson said that it had been recommended that paragraph 7, which entitled the assistant to only 14 days' sick pay, should be extended to entitle the assistant to two weeks' sick leave on half pay in addition to the two weeks at full pay.

The Committee agreed to the recommendation.

Paragraph 10 was to the effect that if the assistant committed any breach of the contract or absented himself from the practice without the consent of the principal or became bankrupt or was guilty of misconduct or neglect prejudicial to the interests of the principal, the principal might end the contract without notice or payment in lieu of notice but without prejudice to any other rights and remedies of the principal. The clause concluded with the following words: " should the contract be determined under this clause then the assistant shall not be entitled to any holiday period or payment in lieu of holiday that might have become due to him under clause 6 hereof."

Dr. Ridge pointed out that the clause was in line with contracts of service between employer and employee in many walks of life, and the Committee agreed that it should not be deleted.

Attachment Schemes

The Committee considered a letter from the Association's solicitor which stated that section 24 of the N.H.S. Act, 1946, imposed a duty on a local health authority to make provision for health visitors whose duty was to visit persons in their homes for the purpose of giving advice. The position about home nurses, under section 25 of the Act was precisely similar. That was an obligation imposed on the health authority but there was nothing in that obligation to prevent the health authority taking other additional measures.

A letter from the Ministry of Health said, however, that the Ministry's lawyers did not accept that, in addition to their *duty* to provide services in patients' homes, local health authorities also had *power* to provide services elsewhere. But this did not mean that the Ministry was any less anxious than general practitioners to encourage attachment schemes as much as possible, and the letter stated that if necessary the Ministry would always be prepared to see if it could assist.

The Committee agreed that it wished to see any impediment to the progress of attachment schemes removed as soon as possible, and that any specific instances of difficulties should be brought to the attention of the Ministry.

Cervical Cytology

A letter received from the Chief Medical Officer of the Ministry of Health about the progress towards establishing a nation-wide cervical cytology service stated that the present aim was to provide facilities for the examination of women over 35 once in five years, and the service was now more than half way to the target. It would involve screening 2,600,000 women each year. In due course the service would be extended, but in the meantime planning of the service must proceed towards its first objective.

The Chairman said that the age limit of 35 was an arbitrary figure and had been fixed by the Ministry so that the demand would be channelled into what, in its opinion, was the high-risk group. However, the Ministry had given an assurance that where possible smears should be done at an earlier age.

The Committee agreed that the Council should seek an opportunity for the Association's *ad hoc* cervical cytology committee to give oral and written evidence to the Ministry's committee on gynaecological cytology.

" Asset " Case

Dr. Speakman commented on the G.M.S. Committee's statement to local medical committees, which had been agreed by the Association's solicitor, about the Court of Appeal's decision in the case of Allen *v.* Thorn Electrical Industries Ltd. (the " Asset " case). The statement had pointed out that the essential feature of the Asset case was that an oral contract had been entered into between an employer and his employees prior to 20 July 1966 to pay an increase in wages. The question to be decided by the courts had been whether that contract was enforceable in view of the Government's incomes policy. However, in law, the statement pointed out, there was no similarity between the circumstances of the Asset case and that of doctors in the National Health Service.

The statement continued: " Prior to 20 July 1966 the Government had accepted the findings of the Review Body and had agreed that general practitioners and hospital staffs should receive increases in pay with effect from 1 April 1966. Nevertheless, by 20 July 1966 this had not been promulgated and neither hospital authorities nor executive councils had received instructions to pay out the additional monies. Neither had they entered into contracts with individual doctors to do so. No contractual relationship between hospital authorities or executive councils and individual doctors existed on which any legal action similar to that in the Asset case could be based. Although the ultimate responsibility for increasing doctors' pay in the N.H.S. rested with the Government, there was no contract between doctors and the Government, and the agreement reached between the profession's representatives and the Government has no legal status until the Regulations putting it into effect are made."

Important Issues

Dr. Speakman said that if that opinion was right it raised some important issues. It stated that there was no contract between doctors and the Government. If that were so with whom had doctors a contract? Presumably the answer was the executive council. If that was so, then why were negotiations not carried on with executive councils instead of with the Government? One possible answer to that question was that executive councils were only agents for the Government via the Ministry of Health. If that was not so nothing agreed with the Ministry was binding on executive councils.

Presuming the contract to be between the executive council and the doctor, then the doctor was not responsible to the Ministry of Health. If he was, then it could be only through the executive council acting as agent for the Ministry, or by the Ministry contracting with executive councils, and the executive councils subcontracting with the doctors. However, since the Minister of Health was responsible to Parliament for the Health Service, there must be somewhere a contract or implied contract between doctors and the Ministry of Health. Whether this was by subcontract with the executive council or by an agency of the executive council did not matter.

After posing further argument based on various suppositions, Dr. Speakman concluded: " Nothing short of a test case which went to the House of Lords will satisfy me as to the true position, and if it turned out that the Asset decision cannot apply to us, or that the Government cannot be shown to have a moral responsibility to apply it, then we must take immediate steps clearly to define, firstly, if we have an enforceable contract with anyone; secondly, with whom that contract is; thirdly, if it is not with the Minister of Health through the executive councils, the legal basis on which we negotiate with the Minister and not executive councils. Having done that, every general practitioner must be made fully aware of his true legal position vis-à-vis the executive council and the Minister of Health."

The Committee agreed that Dr. Speakman's comments should be referred to the solicitor.

Negotiating Machinery for Hospital Doctors.

In formally adopting its new terms of reference on 25 July the Joint Consultants Committee relinquished its position as the sole negotiating body for hospital medical staff. The new terms of reference are:

A. To formulate policy and to consider all matters of policy that may from time to time arise relating to consultant and hospital practice, including (1) the maintenance of standards of professional knowledge and skill; (2) the encouragement of education and research; (3) the utilization to the best advantage of skills and resources, but excluding the remuneration and terms of service of hospital medical and dental staff and so that the committee shall not engage in the pursuit of political purposes.

B. To discuss (either alone or jointly with other bodies) with the Ministry of Health, the Scottish Home and Health Department, and other appropriate bodies all matters falling within the terms of the foregoing paragraph.

C. To nominate members of such bodies as the committee may from time to time decide.

The interim Negotiating Subcommittee of the Central Committee for Hospital Medical Services has taken over from the Joint Consultants Committee the functions of negotiating the terms and conditions of service of hospital medical staff. Its terms of reference are:

(1) To negotiate with the health departments and other authorities on the remuneration and terms of service of hospital medical and dental staff.

(2) To prepare and present evidence to the Review Body on behalf of hospital medical staff, and to do all such things as may be necessary in connexion therewith, including consultation with expert advisers, maintenance of liaison with other branches of the medical profession, and the appointment of members to give oral evidence.

(3) To report regularly to, and receive the views of, the Central Committee for Hospital Medical Services and the Joint Consultants Committee.

(4) To undertake such of the work of the Staff Side of Committee B of the Medical Whitley Council as is not otherwise covered by these terms of reference for so long as that Committee remains in "suspended animation."

Negotiating Subcommittee

The membership of the Negotiating Subcommittee is to be reviewed at the first meeting of the parent committee in the new session. It now consists of Dr. C. W. Clayson; Sir John Richardson, Bt.; Dr. K. Robson; Sir Thomas Holmes Sellors; and Dr. Derek Stevenson (nominated by the Joint Consultants Committee); Mr. J. R. Blackburne; Mr. H. G. Hanley; Mr. N. G. C. Hendry; Mr. H. H. Langston; Mr. W. S. Lewin, and Dr. R. M. Mayon-White (appointed by the Central Committee for Hospital Medical Services); Mr. P. W. R. M. Alberti, Dr. D. Guttman, and Dr. E. A. Harvey-Smith (appointed by the H.J.S. Group Council); Mr. N. L. Rowe (appointed by the Central Dental Consultants and Specialists Committee).

At the Negotiating Subcommittee's first two meetings the main items considered were evidence for the Review Body and the question of what work was outside a doctor's contractual hospital duties and for which therefore a fee could be charged. Schedules of work which is within and which is without the scope of N.H.S. hospital and specialist services are set out in Categories I and II of the terms and conditions of service of hospital medical and dental staff in the section headed "Retention of Fees." A preliminary discussion has been held with Ministry officials on the principles involved, and the Subcommittee stressed the view, stated out in paragraph 50 of "An Appraisal of the Hospital Service" (*Supplement*, 17 July 1965, p. 70), that "any services which are not directly concerned with the prevention, diagnosis, and treatment of illness should be regarded as outside the scope of the National Health Service."

"Committee of Nine"

The nine negotiators appointed by the Joint Consultants Committee in December 1966 to negotiate with the Health Ministers on the basis of the B.M.A.'s memorandum "Current Problems of Hospital Medical Staff" (the hospital doctors' "charter": *Supplement*, 13 May, p. 93) are to continue their task until it is completed. The joint first report on the negotiations was printed in the *Supplement* of 27 May (p. 135), and a second report is expected shortly.

The nine negotiators ("Committee of Nine") are: Sir Thomas Holmes Sellors (Chairman of the Joint Consultants Committee); Sir John Richardson, Bt. (Vice-Chairman of the Joint Consultants Committee); Mr. H. H. Langston (Chairman of the Central Committee for Hospital Medical Services); Mr. N. G. C. Hendry (Chairman of the Scottish Committee for Hospital Medical Services); Drs. J. R. Bennett, E. A. Harvey-Smith, W. P. U. Kennedy, and T. H. Taylor (Hospital Junior Staffs Group); and Mr. D. S. Hayton-Williams (Central Dental Consultants and Specialists Committee).

Appointment of Police Surgeons

The Annual Representative Meeting at Bristol accepted a memorandum submitting a case for a review of the terms and conditions of service of police surgeons which had been prepared by the Association of Police Surgeons of Great Britain and approved by the Private Practice Committee and the Council of the B.M.A. (*Supplement*, 13 May, p. 104).

The B.M.A. is trying to get a national agreement with the police authorities on the terms and conditions of service of police surgeons. The Home Office has an interest but no mandatory authority in the matter. It has accepted in principle the objectives outlined by the B.M.A. for a forensic medicine service to the nation, but it cannot instruct local authorities.

The Private Practice Committee has heard that some local authorities are seeking, in advance of a general agreement, to make local agreements with doctors which could prejudice the long-term interests not only of the doctors concerned but of the community. The Committee hopes that doctors will make their services available to the police during any period before the terms and conditions of service for police surgeons are settled. Negotiations are continuing. But doctors are urged meanwhile not to accept any contract offered to them by a police authority which imposes an obligation to be on call which is contrary to the B.M.A. recommendations, or to accept a scale of fees which is contrary to the recommendations. The Committee states that no contract should be accepted unless it binds the police authority to retrospective adjustment based upon the outcome of the negotiations now in progress.

The Committee further suggests that for the time being no agreement which departs from the B.M.A.'s recommendations and which is not regarded by both sides as an *ad hoc*, interim arrangement should be made for more than three months.

Doctors in any doubt about the terms being offered to them by a police authority are requested to seek advice from the Secretary of the B.M.A. before concluding any arrangement.

Fees for Life Assurance Examinations

The Life Offices Association has agreed to increase the fee for a "short" form of medical report for life assurance purposes from £1 10s. to £2 2s., subject to the inclusion of blood-pressure readings in the medical report.

The following fees are also paid for medical reports for life assurance: full examination and report, £3 3s.; report without examination of the proposer, £1 11s. 6d.

Increase in Part-time Fees

The B.M.A. has agreed with the Treasury a 10% increase in the fees for part-time medical services for Government departments, back-dated to 1 October 1966. The existing fees are set out in Section XI ("Fees for Part-time Medical Services") of the *Members Handbook* (B.M.A., London, 1965).

Discussions are continuing with the Treasury on certain special fees.

H.M. Forces

Surgeon Lieutenant-Commanders D. G. L. Davies, W. M. Mackean, B. W. Petty, and E. J. Williams, R.N.R., have been awarded the Royal Naval and Royal Marine Forces Reserve Decoration.

Appointments.—Wing Commander J. E. Routh (senior medical officer, R.A.F. Headquarters Unit, High Holborn); Wing Commander W. E. J. Kirby (senior medical officer, R.A.F. Oakington); Wing Commander J. B. Parsons (anaesthetic duties, Princess Mary's R.A.F. Hospital, Halton); Wing Commander J. K. Oyston (orthopaedic duties, R.A.F. Hospital, Cosford); Wing Commander E. Ward (registrar, R.A.F. Hospital, Cosford); Wing Commander R. W. Povey (orthopaedic duties, R.A.F. Hospital, Wegberg, Germany); Wing Commander R. G. Covell (senior medical officer, R.A.F. Luga, Malta); Wing Commander S. C. Rexford-Welch (directing staff duties, Royal Naval Medical School, Alverstoke).

ROYAL NAVY

Surgeon Captain W. Wilson has been placed on the Retired List.

Surgeon Lieutenant-Commander G. D. Lister has been placed on the Emergency List.

Surgeon Lieutenants D. J. McKay and D. M. Davies to be Surgeon Lieutenant-Commanders.

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonels S. B. Telford, D. H. Provan, J. D. Hughes, and J. B. J. Mulvey have retired on retired pay.

Majors I. A. R. Watson, E. R. Briant, T. M. Goodall, A. H. Dimond, and H. Q. Hutchings to be Lieutenant-Colonels.

Captains H. MacD. Sanderson and D. K. M. Thomas to be Majors.

Short Service Commissions.—Major W. D. Smith has relinquished his commission. Captain J. D. Garry to be Major.

REGULAR ARMY RESERVE OF OFFICERS

Royal Army Medical Corps

Lieutenant-Colonel G. C. Dansey-Browning, having attained the age limit, has retired, retaining the rank of Lieutenant-Colonel.

Lieutenant-Colonel A. R. Horler, from T.A., to be Lieutenant-Colonel.

Lieutenant-Colonel K. W. N. Palmer, E.R.D., T.D., from A.E.R.O., to be Lieutenant-Colonel.

Major G. T. Curtis, from A.E.R.O., to be Major.

Major A. F. Dukes has resigned his commission, retaining the rank of Major.

Short Service Commission.—Major A. Bennett, from Active List, to be Major.

ROYAL AIR FORCE

Air Commodore P. J. O'Connor, O.B.E., has been appointed Honorary Physician to the Queen in succession to the late Air Vice-Marshal W. K. Stewart, C.B., C.B.E., A.F.C., Q.H.P.

Air Commodore L. M. Crooks, C.B.E., Q.H.S., to be Air Vice-Marshal.

Group Captains E. B. Bright, A.F.C., and M. W. L. White to be Air Commodores.

Group Captains P. A. Lee and J. L. Roche have retired at their own request.

Group Captain A. S. Amsden has retired.

Wing Commanders H. A. N. Hammersley and C. J. W. Soutar, M.B.E., to be Group Captains.

Wing Commander Elspeth M. McKechnie to be Group Captain (woman medical officer).

Wing Commander F. G. Cumming, M.B.E., has retired at his own request.

Squadron Leaders F. S. Black, B. A. J. Barrow, and D. L. Price to be Wing Commanders.

Squadron Leader R. T. A. Ross has been transferred to the Reserve.

Flight Lieutenants S. B. Lydon, B. C. Corke, D. F. V. Matthew, and D. M. Denison to be Squadron Leaders.

Royal Air Force Reserve of Officers

Flight Lieutenant W. C. Hetherington to be Squadron Leader.

Association Notices

Amalgamation of Redbridge and Stratford Divisions

Notice is hereby given by the Council to all concerned that as from 1 October 1967 the Redbridge Division and the Stratford Division will be amalgamated to form the Redbridge and Stratford Division.

DEREK STEVENSON,
Secretary.

Diary of Central Meetings

AUGUST

17 Thurs. Public Health Committee, 3 p.m.

23 Wed. Hospital Junior Staffs Group Executive Committee, 2 p.m.

SEPTEMBER

13 Wed. Joint Formulary Committee, 10.30 a.m.

21 Thurs. General Medical Services Committee (Scotland) (at 7 Drumsheugh Gardens, Edinburgh), 2.15 p.m.

22 Fri. Hospital Junior Staffs Group Council, 11 a.m.

22 Fri. Planning Unit, 4.30 p.m.

29 Fri. Joint Committee of B.M.A. and Magistrates' Association, 11 a.m.

Branch and Division Meetings to be Held

Members proposing to attend meetings marked ● *are asked to notify in advance the honorary secretary concerned.*

WEST SUFFOLK DIVISION.—At Walsham-le-Willows, near Bury St. Edmunds, Thursday, 17 August, 8 p.m., fête-champêtre and barbecue. Guests are invited.●

Branch and Division Officers Elected

AYRSHIRE DIVISION.—Chairman, Dr. T. Rutherford. Chairman-elect and Vice-chairman, Mr. R. H. Simpson. Honorary Secretary, Dr. A. G. Sked. Honorary Treasurer, Dr. B. R. Nisbet

CITY DIVISION.—Chairman, Dr. M. G. O'Donoghue. Vice-chairman, Dr. M. Ross. Honorary Secretary, Dr. A. C. M. Inwald. Honorary Treasurer, Dr. J. M. Alston.

DUMFRIES AND GALLOWAY DIVISION.—Chairman, Dr. A. H. L. Wilson. Chairman-elect, Mr. W. Seright. Honorary Secretary and Treasurer, Dr. J. B. Wilson. Assistant Honorary Secretary, Dr. P. Pearce.

EAST DENBIGH AND FLINT DIVISION.—Chairman, Dr. K. Gammon. Vice-chairman, Dr. H. W. James. Honorary Secretary and Treasurer, Dr. W. E. Lewis.

EAST HERTS DIVISION.—Chairman, Dr. J. M. W. Sedgwick. Vice-chairman, Dr. W. H. Allen. Honorary Secretary and Treasurer, Dr. J. A. Hersey.

GREENWICH AND DEPTFORD DIVISION.—Chairman, Mr. W. R. O'Flynn. Chairman-elect and Vice-chairman, Dr. Jeane B. Donaldson. Honorary Secretary, Dr. N. H. Smith. Honorary Treasurer, Dr. D. L. T. Parsons.

GUERNSEY AND ALDERNEY DIVISION.—Chairman, Dr. J. B. Tucker. Vice-chairman, Dr. T. A. Fox. Honorary Secretary, Dr. T. A. Fox. Assistant Honorary Secretary, Dr. A. B. Seth-Smith. Honorary Treasurer, Dr. J. C. Bulstrode.

HALIFAX DIVISION.—Chairman, Dr. D. L. S. Johnston. Chairman-elect, Dr. J. D. G. Turner. Vice-chairman, Mr. A. B. Hamer. Honorary Secretary and Treasurer, Dr. P. H. Holmes. Assistant Honorary Secretary, Dr. D. Lightley.

HOLLAND DIVISION.—Chairman, Dr. R. G. Flower. Chairman-elect, Mr. R. F. Lawrence. Honorary Secretary and Treasurer, Dr. J. D. Brackenridge.

KETTERING DIVISION.—Chairman, Dr. J. Notley. Vice-chairman, Dr. T. Partington. Honorary Secretary, Dr. N. Cash. Honorary Treasurer, Dr. P. Rowe.

KINGSTON-UPON-THAMES DIVISION.—Chairman, Dr. G. G. Pollock. Chairman-elect and Vice-chairman, Dr. L. D. de Launay. Honorary Secretary, Mr. J. V. O'Sullivan. Assistant Honorary Secretary, Dr. G. Cohen. Honorary Treasurer, Dr. R. B. Ottley.

LANARKSHIRE DIVISION.—Chairman, Dr. H. A. Gibb. Vice-chairman, Dr. C. C. Cuthbert. Honorary Secretary and Treasurer, Dr. A. G. Jamieson. Assistant Honorary Secretary, Dr. R. J. Lumsden.

LINCOLNSHIRE BRANCH.—Mr. F. Joselin Jauch. President-elect, Dr. A. C. Fraser. Vice-presidents, Dr. C. F. E. Stanford, Dr. J. E. Darlow. Honorary Secretary, Dr. H. G. H. Richards.

NORTH GLAMORGAN AND BRECKNOCK DIVISION.—Chairman, Mr. R. H. B. Mills. Vice-chairman, Dr. F. J. Doherty. Honorary Secretary, Dr. J. B. R. Lewis. Assistant Honorary Secretary and Treasurer, Dr. W. B. Davies.

SOUTH-EAST ESSEX DIVISION.—Chairman, Dr. D. Caldwell. Chairman-elect, Dr. G. Leyden. Vice-chairman, Dr. B. Quinn. Joint Honorary Secretaries, Dr. A. Clappen, Dr. D. Hayley. Honorary Treasurer, Dr. A. Clappen.

SOUTH EASTERN COUNTIES DIVISION.—Chairman, Dr. A. F. McCoubrey. Chairman-elect and Vice-chairman, Dr. R. M. McGregor. Honorary Secretary and Treasurer, Dr. T. B. Anthony.

SOUTH WARWICKSHIRE DIVISION.—Chairman, Mr. M. W. Smith. Chairman-elect, Dr. A. R. McWhinney. Honorary Secretary and Treasurer, Dr. J. R. Lamb.

SURREY BRANCH.—President, Mr. G. N. Golden. President-elect, Dr. W. S. Lund. Vice-president, Dr. J. H. Newmark. Honorary Secretary, Dr. G. Slot. Honorary Treasurer, Dr. J. H. Moir.

SUTHERLAND DIVISION.—Chairman, Dr. R. F. Antonio. Vice-chairman, Dr. K. J. Macdonald. Honorary Secretary and Treasurer, Dr. J. Macleod.

SUTTON DIVISION.—Chairman, Dr. P. Westcombe. Chairman-elect and Vice-chairman, Dr. W. Unger-Hamilton. Honorary Secretary, Dr. Rosemary Hill. Assistant Honorary Secretary, Dr. W. Unger-Hamilton.

In the *Supplement* of 15 July (p. 68) it was stated that at the meeting of the General Medical Services Committee (*Supplement,* 8 July) Dr. C. J. Wells had been wrongly reported (p. 20) as speaking on the subject of information to hospitals. It was Dr. D. B. Wallis who spoke on this matter.

Negotiations with N.H.S. Hospital Doctors and Dentists: Joint Second Report

Printed below is the second report on the negotiations which have been continuing between the Health Ministers and their Departments and representatives of hospital medical and dental staff. The first report was published in May (Supplement, 27 May, p. 135). The negotiations, which began in December 1966, have been on the memorandum, "Current Problems of Hospital Medical Staff" (Supplement, 13 May, p. 93), prepared by the Central Consultants and Specialists Committee (now named the Central Committee for Hospital Medical Services) of the B.M.A. The professions' negotiators have been the "Committee of Nine" (Supplement, 12 August, p. 117) and the members of the special working groups or "panels." The three appendices to the second report are printed in summarized form. The report and appendices are to be sent to hospital authorities.

1. In the Joint First Report on the negotiations between the Health Departments and the representatives of hospital doctors and dentists it was stated that the intention was to issue a full report later this year. Agreements would, however, continue to be implemented as quickly as possible, without awaiting the final report. This Joint Second Report gives an account of agreements reached since the issue of the first report.

2. Two further plenary meetings have been held, with the Minister of Health in the Chair, and there have been a number of meetings of the working groups (panels) described in the first report. The special working party of the Compensation and Superannuation Committee of the B.M.A. set up to consider pension matters submitted a memorandum and met representatives of the Health Departments for a first discussion on 2 August.

3. Effect has now been given to the agreement, described in paragraph 5 of the first report, that boards should advertise additional consultant posts or re-advertise vacant posts in order to establish whether or not there are doctors well qualified by training and experience for consultant posts who have hitherto been deterred from applying for them because they have not spent sufficient time in the senior registrar grade. All requests from boards for additional posts will be considered by the Advisory Committee on Consultant Establishments, a joint committee of representatives of the profession and the Ministry of Health which considers for approval all requests for the establishment of new consultant posts. Doctors with satisfactory training will not be excluded from consideration merely on the ground that they have spent little or no time in the senior registrar grade.

Staffing Structure

4. Discussions continue in Panel 1 (manpower, career structure, career planning) on a revision of the staffing structure which will facilitate integrated training schemes, on special measures in respect of registrars who have spent a long time in the grade, and on improvements in the medical assistant grade. The work of this panel is of the greatest complexity and importance. It is being pressed forward as quickly as possible but cannot be hurried. Before it can be completed, wider consultation within the profession is likely to be desirable.

Workload and Study Leave

5. The work of Panel 2 (workload and study leave) has now been completed. In the first joint report it was stated that agreement had been reached in principle on possible ways of identifying and rewarding excessive duty but that a reference had been made to the Review Body on Doctors' and Dentists' Remuneration on a difference of opinion about the extent to which they took account of excessive duty in their Seventh Report. The Review Body have now replied that in recommending substantially increased salary levels for junior staff they took into account the excessive workload that could result for remaining staff when posts were vacant. Accordingly the professions and Health Departments will now submit their agreement on the principle of extra duty allowances to the Review Body for "pricing" at their next review. Meanwhile boards are being advised that the normal response to any unplanned or prolonged staff absence, where duties cannot be reorganized, should be the engagement of a locum. The memoranda on minimum off duty time and study leave issued at the time of publication of the first report are also relevant.

6. Panel 2 has also considered some of the problems that arise from those departments, usually described as casualty departments, which attempt to provide a twenty-four-hour service for accidents and emergencies even though the work does not justify full manning on this basis. It is agreed that the need for such provision should be exceptional and that, in general, accident and emergency services should be concentrated in departments fully manned by staff specifically appointed for the purpose, but where this has not been possible special problems arise. Agreement has been reached on a number of principles that should govern the staffing of such departments. It has also been agreed that there should be special arrangements for extra duty allowances in these departments. The nature of these arrangements has not yet been settled and the "pricing" of the allowance, as of extra duty allowances generally, is a matter for consideration by the Review Body at their next review. The conclusions of Panel 2 on these matters are described more fully in Appendix 1.

7. The conditions of locum service have been considered and agreement reached on the removal of various disadvantages of locum as compared to regular service; these will be given effect in a hospital memorandum to be published shortly. The improvements will enable locum service in a grade to count in part towards incremental credit on appointment to a regular post in that grade.

Improvements have also been agreed in the arrangements for travelling expenses and sick leave for locums. Consideration is being given to remuneration in lieu of annual leave which cannot be taken during the course of the locum appointment.

8. In discussion of the reference in the professions' memorandum to medical administration the Health Departments and the professions agreed on the importance of this work and are united in a desire to see an increase in the number of doctors qualified by training and experience to be medical administrators.

Medical Research

9. Consideration has been given to the part to be played by the hospital service in furtherance of medical research. Basic long-term medical and dental research and opportunities for medical research as a career are primarily the concern of the universities and Medical Research Council, but the National Health Service provides unique opportunities for research, and it is important to create conditions in which hospital doctors can carry it out. Indeed they should be encouraged to initiate projects which may be of value and should be able to make reasonable use of secretarial and other facilities (for example, to establish the value of a project). The Health Departments assured the representatives of the professions that the provision of time for research within contractual sessional time should be possible where this is necessary, and did not consider it appropriate for sessional time to be permanently allocated to research in the contract. They agreed that it was important that applications for approval of research projects should be dealt with expeditiously.

10. The scope of the research activities already being undertaken within the hospital service is far wider than is often appreciated. The Departments supplied information about the measures that have and continue to be taken to support research, to bring hospital libraries up to date, and on the use of computers and other technical equipment in the National Health Service, and this information is reproduced as Appendix 2 to this report.

General Conditions of Service

11. Panel 3 (conditions of service generally) have completed their examination of removal expenses, annual leave and sick leave, telephone expenses, ancillary help, quarters (including married quarters), and provision of meals. They still have to consider the problem of home-to-headquarters mileage allowances, on which the Health Departments await further evidence being prepared by the professions. Mileage allowances generally have been discussed for some considerable time in the General Whitley Council and elsewhere, and an account of the discussions is given in Appendix 3. An interim increase in rates has recently been made.

12. The following hospital memoranda giving effect to the agreements reached in the Panel have been published since the first report: (*a*) H.M. (67) 37, "Improvement in Sick Leave Entitlements" (15 June); (*b*) H.M. (67) 39, "Extension of Present Arrangements for Assistance with Removal Expenses" (22 June); (*c*) H.M. (67) 44, "Reimbursement of Telephone Expenses (18 July).*

13. A hospital memorandum on the need for the provision of residential accommodation for hospital staff is in preparation, and will deal with ways in which hospital authorities can help in this. The Panel has also considered the arangements in England and Wales for determining the rents of hospital-owned flats and houses. A hospital memorandum bringing together the existing circulars as a single document, and extending the present discretion of hospital authorities in rebating rents charged to medical staff who are compulsorily resident, is also in preparation.

14. It is agreed that there is a good case for an increase in annual leave for registrars from four weeks to five. An improvement in annual leave is, however, in the context of the Government's Prices and Incomes policy, equivalent to an increase in remuneration (see paragraph 20 of Cmnd. 3235), and the attention of the Review Body will be drawn to the matter.

15. The Health Departments cannot accept the professions' strongly argued contention that any non-resident doctor kept on duty, recalled for duty, or required to be resident overnight should not have to pay for meals taken in hospital on these occasions. In their view such a request is clearly contrary to one of the principles which the Review Body assumed would be followed in making the recommendations on remuneration in their seventh report—namely, that "all doctors, whether . . . they are on duty or off duty, should pay for meals they take in hospital." The Health Departments had agreed before the Review Body reported that a non-resident doctor recalled from his home while not on duty (or on call), in circumstances accepted as constituting an emergency, or detained on duty in such circumstances, need not be charged for refreshment provided. They do not propose to withdraw this concession but see no justification for extending it.

Scottish Panel

16. The Scottish Panel has met twice since the first joint report was issued. Memoranda on the extension of existing arrangements for assistance with removal expenses and the reimbursement of telephone expenses have been issued, and the various reports and papers referred to in the foregoing paragraphs have been considered from a Scottish aspect. The arrangements for fixing rents of hospital accommodation in Scotland differ from the arrangements applying in England and Wales, but the Panel is reviewing the Scottish position on the same lines as described in paragraph 13.

Final Report

17. It remains the intention that a full and final report on the negotiations should be issued later. Agreements will continue to be implemented as quickly as possible, without awaiting the final report.

---

* These circulars were summarized in the *Supplement* to the *British Medical Journal* on the following dates: 17 June, p. 175 (Sick Leave); 1 July, p. 12 (Removal Expenses); 5 August, p. 110 (Telephones).

Summarized Appendices

I. Relief of Excessive Work Load

The Review Body is to recommend how the agreement of the Departments and the professions on the principle of extra-duty allowances should be given effect. Meanwhile, excessive work load is not to be regarded as an unavoidable feature of medical life but as a problem requiring action. The first response to excessive work load (boards are advised) should be to try to reorganize duties, and when nevertheless unreasonable work load persists the appointment of a locum should be the normal remedy.

"Unreasonable" has been defined, in relation to the provisions on guaranteed minimum time off duty (*Supplement*, 27 May, p. 136) as follows:

(*a*) when failure to fill a post will significantly affect the service available to patients unless a substantial part of the work of the post is done by other staff; (*b*) when the medical staffing of a hospital is such that the maintenance of essential services during absences would result in excessive work for the staff remaining; (*c*) when other circumstances give rise to an exceptionally heavy workload, such as an excessive sickness rate among staff; (*d*) when a post is vacant or the holder is absent for any reason and the minimum off-duty periods would be available to staff only at the expense of unreasonable conditions for patients or for staff during working hours.

When a locum cannot be obtained boards should be authorized to pay an extra duty allowance to the staff carrying the duties for which a locum had been sought. The Review Body will be asked to "price" the allowance.

It has been agreed that hospital authorities should be asked to review the work of casualty departments to ensure (*a*) that preregistration house-officers should never work unsupervised in them; (*b*) that when regular duties in casualty departments are to be required of junior staff this should be mentioned in the advertisement and in the letter of appointment; (*c*) that duties in casualty departments should not be combined simultaneously with other liabilities unless there are overriding reasons stemming from either the isolation of the hospital or the sparsity of the population served.

Eligibility for extra duty allowances in casualty departments should extend to situations when liability for duty must be undertaken simultaneously with liability for duty in other departments and excessive work load results. The pricing of the allowances would be a matter for the Review Body.

The professions strongly contend that all doctors (including general practitioners) other than casualty officers doing sessions in casualty should be paid at the same appropriate sessional rate. The Health Departments argue that frequently some additional burden can be accepted without imposing an unreasonable work load, but they accept "that there should be a prima facie case for recognizing excessive work load in casualty departments not only when the agreed minimum time-off periods are not available but whenever hours of duty and on-call are increased through the incidence of casualty duty by more than one night on call in each week (subject to a qualifying period) whether or not the employment of a locum is justified. Both sides will give evidence independently on this subject to the Review Body."

II. Research

Medical research in its broadest sense is supported by public funds from three main sources: the University Grants Committee; the Medical Research Council; and the Ministry of Health. In 1966–7 expenditure on research by university departments of medicine and allied subjects was about £16m. The Medical Research Council spent £770,000 in 1948–9, £11½m. in 1966–7, and in 1967–8 it is estimated it will spend £14m. Roughly two-thirds of this sum goes to support the Council's own staff and units—mainly in universities and teaching hospitals. The remaining one-third goes on grants, usually short-term, to individual research workers—the majority in university, medical school, or teaching hospital departments. The Ministry of Health spent £1.5–£2m. on research and development in 1966–7 and will spend an estimated £2.5m. in 1967–8. The current expenditure by the Scottish Home and Health Department is estimated at £190,000.

Hospital authorities in England and Wales and Scotland may use non-exchequer funds for research subject to the terms of individual trusts. A proportion of the endowment funds of the Scottish hospitals taken over in 1948 was used for the establishment of a Scottish Hospitals Endowments Research Trust, which makes grants to research workers in hospitals and universities. The annual income of the Trust is about £120,000.

Roughly speaking the Health Departments' role is to initiate and support research and development as a direct aid to the discharge of their own policy and responsibilities, while the Medical Research Council is the government agency responsible for the support, advancement, and proper balance of research in the medical sciences.

Research Financed by Departments

About two-thirds of the Ministry's expenditure on research and the greater part of that of the Scottish Home and Health Department is on centrally promoted projects. The remainder is on decentralized research. Centrally promoted projects are undertaken by universities, other academic and research institutions, individuals, and hospitals acting on behalf of the Departments.

Hospital circulars H.M. (57) 36 (England and Wales) and S.H.M. (57) 60 (Scotland) described the arrangements for a scheme for locally organized research to be carried out at the expense of Exchequer funds. Further guidance to boards on conditions under which grants from decentralized funds should be distributed was issued in June 1964.

The scheme is complementary to the Medical Research Council's scheme of temporary research grants to individuals, and is intended to encourage local initiative in research and foster local talent. In England and Wales the scheme has become the mainstay of support for research in district hospitals and an increasingly important supplementary service in some teaching hospitals. Allocations under this heading in 1966–7 amounted to about £600,000. Boards are being encouraged to include local authority and general practitioner representatives on the local research committee and to make grants available to individuals in all three parts of the service. In Scotland current expenditure under the scheme is £10,000.

The Medical Research Council's advice is sought on major projects, and when possible collaboration is arranged. Links are also being established with the Social Sciences Research Council, and there is consultation and collaboration in special fields with a number of Government departments—for example, the Ministry of Technology over the use of computers in medicine.

Libraries

Advice on the organization of hospital libraries is being prepared. The staff library in each hospital group will be expected to have a basic stock of books covering the needs of doctors and dentists and all other hospital staff and to subscribe to the important journals in each field. There should be a good selection of "reference tools" (including the *Index Medicus*, the principal abstracting journals, and the main bibliographies), a subscription to one of the medical and scientific circulating libraries, and arrangements to borrow from national libraries. A qualified librarian will be able to give assistance to doctors and dentists in the most economical use of the newly developed mechanized bibliographical services.

All boards are advised that accommodation for research should be provided in new hospitals.

Research Equipment

The Health Departments are giving increasing attention to the development and evaluation of medical equipment. Particular interest attaches to items such as the use of ultrasonics and thermography in diagnosis, the laser, fibre optics, the automation of pathological laboratory work, pattern recognition systems for the detection of malignant cells, artificial kidneys, and patient monitoring devices. It is expected that about £400,000 will be spent in 1967–8.

Medium-sized computers are likely to be installed for research, experimental, and routine use in a few major hospitals before 1970. Their use on this comparatively small scale will pave the way for the more widespread provision of computing facilities in following years. Among the most important functions proposed for hospital computers is the storage, maintenance, and sorting of patient records. This, as well as aiding the efficiency of hospital activities, will enable more analysis of patient records to be undertaken for research purposes.

III. Mileage Allowances

Mileage allowances are a matter for all hospital employees, and therefore they are discussed in the General Whitley Council. General Council agreements, however, apply to hospital medical and dental staff only if the Staff Side of Medical and (Hospital) Dental Committee B agree. The last general revision of mileage rates was in 1965, but the Staff Side of Committee B refused to accept the increase (of ¼d. a mile) for medical and dental staff. The Management Side of Committee B did not accept that there was a case for special treatment for hospital medical and dental staff, and the matter was referred back to the General Council.

In Panel 3 of the current negotiations the professions successively proposed:

(1) That hospital staff (especially junior staff) should be assisted with car purchase—e.g., by the provision of loans at low rates of interest or even free of interest.

(2) That mileage allowances should (*a*) include an annual lump sum to cover depreciation and interest on capital; or (*b*) be on a steeply graduated scale of rates per mile, so as to cover a relatively high proportion of the standing charges in the early miles; or (*c*) cover (for every mile travelled on duty) the total cost of motoring as calculated by the A.A. or by the R.A.C. at 10,000 miles per annum.

The principal objection to these proposals, other than that for assistance with car purchase, was that they involved reimbursement on a scale which was, in the Health Departments' view, likely to be substantially in excess of expenditure properly attributable to motoring on official business. The proposal for assistance with car purchase was rejected on the grounds that there were many more pressing demands on National Health Service resources and that loan facilities for car purchase were readily available from banks and hire purchase finance companies.

The General Whitley Council has agreed that a survey should be undertaken to obtain information about the actual annual mileages travelled by N.H.S. officers on official business and, pending the results of the survey (on which a progress report is to be made by 15 September), that there should be an interim increase in mileage rates. For doctors and dentists these will be ¾d. a mile for the first 7,000 miles a year and ½d. a mile thereafter.

In accepting this interim settlement for hospital medical and dental staff the Staff Side of Committee B has stated:

> "(1) The medical and dental professions do not regard these interim increases as reflecting at all adequately the rise in motoring costs since 1952; and (2) having regard to the complete dependence of the hospital service upon the willingness of doctors and dentists to use their private cars upon the business of the hospital authorities, the medical and dental professions greatly regret that their current efforts to negotiate a fair rate of reimbursement for the use of private cars on N.H.S. business (which began with the submission of their first memorandum on 17 March 1966) are not yet within sight of a conclusion."

B.M.A. Nuffield Library

The Library service is available to all members of the Association resident in Great Britain and Northern Ireland (and by special arrangement to members of the Irish Medical Association). A copy of the library rules will be forwarded on application to the Librarian at B.M.A. House.

The following books have been added to the Library:

Myerson, R. M. and Pastor, B. H.: Congestive Heart Failure. 1967.
Nelson, R. S.: Gastroscopic Photography. 1966.
Ravin, A.: Auscultation of the Heart, 2nd edition. 1967.
Rowe, J. W. and Wheble, V. H.: A Concise Textbook of Anatomy and Physiology, 2nd edition. 1967.
Schulenburg, C. A. R.: Operative Cholangiography. 1966.
Sears, W. G.: Medicine for Nurses, 10th edition. 1966.
Smith, J. L. (Editor): Neuro-ophthalmology, Volume III. 1967.
Smith, M. J. H. and Smith, P. K.: The Salicylates. 1966.
Stewart, W. D., Danto, J. L. and Maddin, S.: Synopsis of Dermatology. 1966.

Verville, E.: Behavior Problems of Children. 1967.
Warick, C. K.: Anatomy and Physiology for Radiographers. 1966.
Welch, C. E.: Surgery of the Stomach and Duodenum, 4th edition. 1966.
Wells, B. B. and Halsted, J. A.: Clinical Pathology, 4th edition. 1967.
Widdess, J. D. H.: The Royal College of Surgeons in Ireland and its Medical School, 1784–1966. 1967.
Wynn, R. M. (Editor): Cellular Biology of the Uterus. 1967.
Young, M. E. J.: Radiological Physics. 1967.

H.M. Forces

ROYAL NAVY

ROYAL NAVAL RESERVE

Surgeon Lieutenants S. J. McDonald, J. R. Newstead, and J. R. N. Curt to be Surgeon Lieutenant-Commanders.

ARMY

Colonels R. J. Niven, M.C., J. McGhie, Q.H.P., and N. G. G. Talbot, O.B.E., T.D., late R.A.M.C., to be Brigadiers.

ROYAL ARMY MEDICAL CORPS

Captain R. D. Whitla to be Major.

REGULAR ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Short Service Commission.—Major A. C. MacLean, from Active List, to be Major.

TERRITORIAL AND ARMY VOLUNTEER RESERVE

ROYAL ARMY MEDICAL CORPS

Colonels T. W. A. Glenister, T.D., and I. C. Seymour, T.D., from T.A., to be Lieutenant-Colonels, relinquishing the rank of Colonel.

Lieutenant-Colonel J. P. W. Hughes, T.D., from T.A., to be Lieutenant-Colonel.

Lieutenant-Colonel B. K. Scott, from T.A., to be Major, relinquishing the rank of Lieutenant-Colonel at his own request.

Lieutenant-Colonels R. M. Stewart and A. R. Foster, from T.A., to be Majors, relinquishing the rank of Lieutenant-Colonel.

Major (Acting Lieutenant-Colonel) A. G. Hutchison, from T.A., to be Major, relinquishing the acting rank of Lieutenant-Colonel.

Majors J. C. Hewitt, S. R. T. Headley, T. Bird, R. A. Goodhead, T.D., D. J. B. Ashley, D. C. Provan, and R. E. D. Simpson, T.D., have been granted the acting rank of Lieutenant-Colonel.

Majors R. M. Gibson, N. E. Shaw, D. W. Sumner, L. Symon, B. R. Stead, and R. S. Kocen, from A.E.R.O., to be Majors.

Majors P. J. Daly, T.D., J. D. C. Turner, K. Boheimer, K. T. Burke, G. B. Smith, J. C. Denmark, R. H. Ramsay, T.D., P. W. Ross, J. P. V. Rigby, W. A. L. Thompson, and I. C. Balfour, from T.A., to be Majors.

Major A. R. Foster has resigned his commission and has been restored to the rank of Lieutenant-Colonel.

Major J. A. Ward, T.D., has resigned his commission, retaining the rank of Major.

Captains (Acting Majors) G. J. H. Everard and B. F. Reeves, from T.A., to be Captains, retaining the acting rank of Major.

Captain G. T. Haysey to be Major.

Captain H. T. Thompson has been granted the acting rank of Major.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel S. Mattingly, T.D., has resigned his commission, retaining the rank of Lieutenant-Colonel.

Major J. F. K. Grieve, T.D., has retired, and has been restored to the rank of Colonel.

Major J. A. Stanton, T.D., has resigned his commission and has been restored to the rank of Lieutenant-Colonel.

Majors K. J. Zilkha and A. W. Howel-Evans have resigned their commissions, retaining the rank of Major.

Majors F. R. Wright and K. F. Kyle have resigned their commissions.

Captain J. Piggot to be Major.

TERRITORIAL ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Major J. Bleakley, M.B.E., having exceeded the age limit, has retired, retaining the rank of Major.

Major G. Savill has resigned his commission, retaining the rank of Major.

Major J. Davenport has resigned his commission.

Captain (Honorary Major) R. C. Connolly has resigned his commission, retaining the honorary rank of Major.

ROYAL AIR FORCE

Flight Lieutenants B. N. M. Oliver and A. Andrew to be Squadron Leaders.

Security of Tenure of Consultant Appointment

This account is based on an article submitted by Dr. P. H. A. Willcox.

A recent appeal to the Minister of Health by a consultant physician concerned the question of a consultant's security of tenure of a hospital appointment when the staff and functions of the hospital are transferred to a new hospital.

The appeal, by Dr. P. H. A. Willcox, was under paragraph 190 of the "Terms and Conditions of Service of Hospital Medical and Dental Staff (England and Wales), 1967." Paragraph 190 of the Terms and Conditions of Service states: "Where a consultant . . . considers that his appointment is being unfairly terminated, he shall be entitled to send a full statement of the facts to the Minister, who will obtain the written views of the Board concerned and place the case before a professional committee . . . for their advice. . . . This procedure shall be completed before the Board's decision to terminate the appointment is carried into effect. . . . " Paragraph 191 states, "It is understood that where a local change of organization in the hospital and specialist services involves displacement or serious disturbance of the services of a consultant . . . the Board recognizes that it has a moral obligation to render the greatest possible assistance to the practitioner with a view to his obtaining comparable work in another hospital."

Transfer Recommended

Dr. Willcox, senior physician to the Windsor group of hospitals, had a maximum part-time contract which included two sessions at Upton Hospital, Slough. When a new hospital was built at Wexham Park to serve Slough and to replace Upton Hospital physicians of the Windsor Group discussed the staffing arrangements at the new hospital, and they recommended that Dr. Willcox's two sessions at Upton Hospital should be transferred to Wexham Park. This was approved by the hospital management committee, and the recommendation was forwarded to the North-west Metropolitan Regional Hospital Board during the summer of 1965.

In November 1965 the Board's Secretary proposed transferring Dr. Willcox's two sessions at Slough to King Edward VII Hospital, Windsor, instead of to Wexham Park Hospital. Dr. Willcox protested on the grounds that (*a*) there was no more work in general medicine available at Windsor where he was already employed for two sessions, so that he would be underemployed by this amount of work; (*b*) it would debar his patients resident in Slough from the benefits of the most modern hospital in the group; and (*c*) it would damage his professional status and consulting practice. His request for an interview with the Board was not granted until 27 May 1966. The Board did not alter its policy after this interview.

On 19 March 1966 the Board advertised a new post of consultant physician at the new hospital. At the end of March the Board invited Dr. Willcox to agree to transfer his two sessions from Slough to Windsor. Dr. Willcox refused, giving notice that he would appeal to the Minister of Health. This he did on 22 April 1966.

On 19 April the Board informed Dr. Willcox that it had decided he would not be offered any appointment at the new hospital, and on 25 April Wexham Park Hospital was opened and all the patients, including 10 under the care of Dr. Willcox, all the consultants in charge of beds except Dr. Willcox, and all the resident medical staff were transferred to it from Upton Hospital.

Minister's Decision

Dr. Willcox's appeal to the Minister was heard on 15 September 1966. The professional committee was under the chairmanship of the Chief Medical Officer, Ministry of Health. The Minister of Health conveyed his decision to the Board on 3 November 1966 in the following terms:

> "The Professional Committee have expressed the view that Dr. Willcox had good grounds for anticipating that his work would be transferred to the new Wexham Park Hospital when Upton Hospital was closed, so that he might continue treating patients in the Slough area. At the same time the committee have recognized that it was reasonable and opportune for the Board to make changes in the organization of consultant staffing in accordance with the general principles recommended in the (Platt) Report on Medical Staffing Structure in the Hospital Service. In the opinion of the Committee, the Board was at fault in not discussing in sufficient detail the plans for reorganization with the medical staff concerned, which would have allowed them to come to an agreed solution; as a corollary, adjustments at Windsor and at the other hospitals in the Group should have been considered before the opening of Wexham Park. The Minister agrees with these views.
>
> "The Professional Committee recommends that the transfer of 4½ hours of Dr. Willcox's time to the Wexham Park Hospital would not be the most effective way of organizing the services at that hospital and that the proposal to concentrate Dr. Willcox's services in the Windsor area by increasing his sessions at King Edward VII Hospital from 2 to 4 is reasonable, provided that a proper and immediate redistribution of work amongst the physicians there takes place to ensure that these additional sessions are effectively employed and Dr. Willcox's grievance is removed. In reaching these conclusions the committee has been influenced by the fact that there is to be considerable development in the area served by the King Edward VII Hospital, Windsor, and Heatherwood Hospital, and suggests that Dr. Willcox be asked to devote some time to assisting in the planning of Heatherwood and the hospital service for Bracknell New Town. The Minister accepts these recommendations."

Dr. Willcox states that since the opening of the new hospital no further work has been made available to him at Windsor other than the two sessions he has had there for many years. In January 1967 the Regional Board granted him the privilege of admitting cases arising in his practice to the new hospital under his own care.

Public Health Service Dispute

After representatives of the local authorities associations had met representatives of the B.M.A. on 17 August it was stated that they had had a "useful discussion" towards "reaching a settlement on the public health medical officers' pay claim." A further meeting of the two sides is to be held on 13 September with a view to settling the differences between them.

In May the Council of the Association asked the British Medical Guild to recommend doctors not to apply for public health appointments until "a firm acceptable offer" of an increase in the pay of all public health medical officers had been made (*Supplement*, 27 May, p. 132). In June 1966, after the Review Body had recommended increases in pay for general practitioners and hospital doctors, the Staff Side of Whitley Committee C lodged a claim for all public health service doctors. The Management Side did not admit to any commitment to review the pay of public health medical offcers with effect from the date of the Review Body recommendations, and up to the present it had refused to make a firm offer in response to the Staff Side's claim.

"Mediflash"

The B.M.A. states that the reaction of police authorities to the Mediflash emergency light for doctors' cars (*Supplement*, 8 July, p. 23) has not been generally favourable. The Home Office has advised that, pending further consultations with chief constables, the issue of these lamps should be held up.

It is expected that the difficulty will be resolved, but there will be delay. When the necessary arrangements have been made through the Home Office lamps will be dispatched immediately to B.M.A. members who have paid for them. Members who ask for a refund will be notified when the lamps are ready for dispatch and asked to send in their remittance. Their orders will then be dispatched.

H.M. Forces

ROYAL NAVY

Surgeon Captain R. M. Latta, R.N., has been appointed honorary surgeon to the Queen, in succession to Surgeon Captain W. Wilson, R.N.

Surgeon Captains M. F. Sheehan and K. J. O'Connor have been placed on the Retired List.

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel J. D. Beavan has retired on retired pay.

Major P. P. Leddy to be Lieutenant-Colonel.

Short Service Commission.—Captain D. M. Callum to be Major.

REGULAR ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

The notification concerning Colonel N. T. Nicol, T.D., published in a *Supplement* to the *London Gazette* dated 9 May 1967, and in the *Supplement* to the *Journal*, 20 May, p. 121, has been cancelled.

TERRITORIAL AND ARMY VOLUNTEER RESERVE

ROYAL ARMY MEDICAL CORPS

Colonel N. T. Nicol, T.D., from T.A., to be Lieutenant and has been granted the acting rank of Captain.

Association Notices

Armed Forces Committee

Nomination of Members for Co-option

The constitution of the Armed Forces Committee was amended at the Annual Representative Meeting of the Association in Bristol in July 1967 to allow greater representation of serving medical officers, especially younger members, by means of co-option to the Committee. It is now open to the Committee to co-opt two representatives, of the rank of major or equivalent (lieutenant-commander or squadron leader) or below, one of whom should preferably be of specialist status, from the medical branch of each of the Services.

Serving medical officers are therefore invited to nominate members of the Association in the armed Forces in these ranks for co-option to the Committee.

Nominations should be sent to the Secretary of the Association by 30 September 1967. The first meeting of the Armed Forces Committee, at which co-opted members will be appointed, will be held in the autumn, and after it nominees will be informed of the appointments made.

DEREK STEVENSON,
Secretary.

Medical Registration

The *Medical Register*, published by the General Medical Council, contains the names of all persons who are fully or provisionally registered on 1 January of the year to which the *Medical Register* relates. It does not contain the names of temporarily registered persons. The names of medical practitioners who are fully or provisionally registered by virtue of Commonwealth qualifications or those of foreign countries are recorded in a Commonwealth or a foreign list respectively.

Unless a doctor is registered under the Medical Act, 1956, he is neither "legally qualified" nor "duly qualified." Only registered practitioners may sign certain statutory certificates (including death certificates), hold medical appointments in public services or hospitals, practise under the National Health Service Acts, possess dangerous drugs, or recover charges in the courts.

A doctor who has passed his qualifying examination in the British Isles may apply for provisional registration. He must supply evidence to the General Medical Council from the university or body concerned that he has gained his degree or diploma. He must also pay a fee of £9. A doctor who is provisionally registered will be deemed to be registered only so far as it is necessary for him to be employed in a resident medical capacity in hospitals which are approved for the purpose of house-officer service.

After obtaining the requisite experience, a doctor holding a registrable qualification granted by a university or other body in the United Kingdom or in the Republic of Ireland, and who is provisionally registered under the Medical Act 1956 of the United Kingdom, is entitled to apply to the General Medical Council to be a fully registered medical practitioner. He will be expected to provide as evidence for the Council a certificate of experience. Section 15 of the Medical Act 1956 states that . . . "(2) A person must, after passing a qualifying examination, have been engaged for the prescribed period in employment in a resident medical capacity in one or more approved hospitals or approved institutions and have obtained a certificate under this section. (3) A person who has been employed as aforesaid may apply to his examining body for a certificate under this section, and if that body are satisfied (*a*) that during the time he has been employed as aforesaid he has been engaged for the prescribed period or minimum period in medicine and for the prescribed period or minimum period in surgery, and (*b*) that his service while so employed has been satisfactory, they shall grant him a certificate in the prescribed form that they are satisfied as aforesaid." Time spent in midwifery may be counted as medicine or as surgery up to a maximum of six months. The fee for full registration is £12.

Registration of Overseas Doctors

Three kinds of registration are open to medical practitioners who have qualified overseas—full, provisional, and temporary registration. Overseas graduates are eligible for full registration only if they have qualified in a country which has reciprocal arrangements with the United Kingdom for the registration of medical qualifications. They must also hold Commonwealth or foreign qualifications which are recognized by the General Medical Council for full or provisional registration (certain qualifications are recognized only when granted to students of specified medical colleges and certain other qualifications are not recognized when they have been obtained before a specified date).

Overseas graduates must also complete 12 months of satisfactory service as a resident house officer (including six months in medicine and six months in surgery) in an approved hospital or have had other professional experience which the General Medical Council will accept as equivalent experience. A fully registered overseas graduate is entitled to engage in any form of professional employment, including hospital work and general practice. No time limit is attached to full registration, and it therefore does not require to be renewed annually or on change of employment.

Provisional

Provisional registration is available to a Commonwealth or foreign doctor if he has qualified in a country which has reciprocal arrangements with the United Kingdom for the registration of medical qualifications and if, as under full registration, he holds Commonwealth or foreign qualifications which are recognized by the General Medical Council for full or provisional registration.

Provisional registration entitles an overseas graduate to work in this country only in resident posts in hospitals approved for the purpose of house-officer service. This type of registration does not require to be renewed on change of employment and is not granted for any specified period.

Temporary

Temporary registration is granted only to Commonwealth and foreign doctors, who must satisfy the Council that they are in the United Kingdom temporarily as distinct from indefinitely or permanently. It may be granted in respect of work in a particular hospital appointment, irrespective of grade. Temporary registration cannot be given in respect of any work outside a hospital or similar institution approved by the Council for purposes of temporary registration.

This type of registration covers an appointment for which an applicant has already been selected, and it needs to be renewed if the appointment is extended or if the practitioner takes up employment in another hospital. "An applicant must also satisfy the Council that he holds a qualification which may properly be recognized by them 'as furnishing a sufficient guarantee of the possession of the requisite knowledge and skill for the efficient practice of medicine, surgery, and midwifery.'" (*The Medical Register*, 1967. p. viii).

Information on registration may be obtained from the Registrar, General Medical Council, 44 Hallam Street, London W.1.

Compulsory Attachment Scheme

Very shortly doctors from abroad coming independently to Britain to look for appointments as house-officers or senior house-officers, and who have not been previously employed in this country, will have to complete a period of clinical attachment (not exceeding one month) before they can be employed by hospital authorities in permanent or locum posts. The requirement will not apply to sponsored overseas doctors nor to those being offered posts in the registrar or higher grade.

The Health Departments introduced a voluntary attachment scheme in July 1966 but it has proved to be unsatisfactory. According to the Ministry of Health very few unsponsored overseas doctors have used the scheme, and this, together with some instances of misuse of the period of attachment, has caused disillusionment among consultants, on whose co-operation the success of the scheme equally depends.

The Medical Director of the B.M.A.'s Commonwealth and International Medical Advisory Bureaux, Dr. R. A. Pallister, thinks the compulsory scheme may add to the anxieties of overseas doctors, who already experience difficulties and delays in entering Britain because of the Commonwealth Immigrants Act. It could lead to Commonwealth doctors seeking postgraduate training elsewhere.

Doctors from overseas whose experience has been recognized as fulfilling the requirements of the General Medical Council for full registration may ask, Dr. Pallister points out, why a further assessment of their ability is required. The freedom of hospital authorities to make appointments will also be restricted.

Doctors during their period of attachment will be paid at the rate of £550 a year and accommodation will be provided free. Meals will be charged for.

B.M.A. Planning Unit

The B.M.A.'s Planning Unit, the functions of which were described in the Annual Report of Council (*Supplement,* 6 May, p. 33), has set up small working parties of experts to advise it on subjects under investigation.

Among the first subjects to be selected for study are the application of mechanical aids for disabled persons and the problems of setting up intensive-care units. Britain is thought to have fallen behind other advanced countries in the provision and utilization of mechanical aids for the disabled, since their existence is unknown to many most likely to benefit from them. Mr. Duncan Guthrie, Director of the National Fund for Research into Crippling Diseases, is chairman of the working party on mechanical aids, and it is hoped that its report will be ready by the spring of 1968.

Dr. E. J. Moran Campbell heads the working party considering general measures for improving the care of acutely ill patients needing continuous supervision and attention. It is making a critical examination of intensive therapy units.

Other subjects being considered by the Planning Unit include computer science in relation to medicine and primary medical care. Suggestions have been received for matters for consideration in the future.

B.M.A. Nuffield Library

The Library service is available to all members of the Association resident in Great Britain and Northern Ireland (and by special arrangement to members of the Irish Medical Association). A copy of the library rules will be forwarded on application to the Librarian at B.M.A. House.

The following books have been added to the Library:

Branch and Division Meetings to be Held

Members proposing to attend meetings marked ● are asked to notify in advance the honorary secretary concerned.

GLASGOW DIVISION.—Tuesday, 5 September, 3 p.m., visit and tour of factory of Messrs. J. Robertson and Sons, Paisley.●

MID-ESSEX DIVISION.—At Medical Academic Unit, Chelmsford, Thursday, 7 September, 8 for 8.30 p.m., meeting to consider questionary submitted by Committee on Functions of the District General Hospital.

NORTH-EAST ESSEX DIVISION.—At Senior Common Room, Essex County Hospital, Wednesday, 6 September, 8.15 p.m., annual general meeting.

HOSPITAL JUNIOR STAFFS GROUP: NORTH-EAST METROPOLITAN REGION.—At B.M.A. House, London W.C., Tuesday, 5 September, 7 p.m., general meeting to discuss evidence for Review Body, and to elect officers.

JUNIOR STAFFS GROUP: SOUTH-EAST METROPOLITAN REGION.—At B.M.A. House, Tavistock Square, London W.C., Tuesday, 12 September, 7 p.m., general meeting to discuss evidence for Review Body, and to elect officers.

Branch and Division Officers Elected

GATESHEAD DIVISION.—Chairman, Dr. J. C. Arthur. Chairman-elect and Vice-chairman, Dr. P. Shadwick. Honorary Secretary and Treasurer, Dr. W. G. A. Riddle. Assistant Honorary Secretary, Dr. M. Spark.

HANNOVER BRANCH.—President, Colonel T. P. H. McKelvey. Honorary Secretary, Captain R. W. Bowman.

HARROGATE DIVISION.—Chairman, Mr. E. J. Somerset. Chairman-elect, Dr. L. H. Moss. Honorary Secretary and Treasurer, Dr. G. N. Tyler.

HARTLEPOOLS DIVISION.—Chairman, Dr. A. Fraser. Vice-chairman, Dr. W. M. Lowry. Honorary Secretary and Treasurer, Dr. R. L. Simpson. Assistant Honorary Secretary, Dr. D. J. Brewer.

Was it a Drug?

Regulation 16 of the National Health Service (Service Committees and Tribunal) Regulations, 1956, provides that when a practitioner prescribes under the National Health Service preparations which are not drugs or medicines, and therefore outside the scope of the Act, the executive council may recover their cost from him. If he challenges the council's action the matter may be referred to the local medical committee. Either party or the Minister can appeal to a referee or referees against the local medical committee's decision.

The referees on each occasion are appointed by the Minister of Health. They must not exceed three in number and they must not be officers of the Ministry of Health. At least one must be a general medical practitioner. In practice the number of referees appointed has usually been three. The chairman has been a layman with legal training, and his two colleagues have been general practitioners selected from a panel chosen by the General Medical Services Committee of the B.M.A.

The findings* of the referees in some recent appeals under the regulations are reported below. The decisions in these, as in all cases, are related only to the circumstances of the particular cases and are not binding on referees who may hear other cases.

Drox Shampoo

The referees considered three cases in which Drox shampoo had been prescribed. On a reference from the executive council the local medical committee in each case had decided that the shampoo was a drug that the executive council was bound to provide. The referees supported this decision in two of the cases.

In the first case the doctor had prescribed Drox shampoo for a patient suffering from psoriasis of the scalp. In reporting their decision that in this case the shampoo was a drug which the executive council was bound to provide, the referees stated that a consultant had advised treatment with an ointment and Drox shampoo. Drox shampoo contained propylene glycol 5%, solution of coal tar 1%, hexachlorophane 1%, and cresol 0.05%. The rest was soap.

The referees said they were referred to the following extract from the "Macgregor Report" [report of the Standing Committee on Classification of Proprietary Preparations (Macgregor Committee)]: "Shampoos . . . normally used for toilet purposes . . . should not be ordered on Form E.C.10. . . . The fact that a drug is present does not of necessity convert the preparation as a whole into a drug." The referees thought that the doctor had not prescribed the shampoo to help the patient wash his hair but as treatment for the psoriasis. The question was whether he had any reason to believe that the treatment would be less effective if the patient had washed his hair with his own soap and then applied propylene, coal tar, hexachlorophane, and cresol.

The doctor had said that Drox was specially apt for removing the scales, which was a necessary preliminary to the administration of the ointment recommended by the consultant, and it acted as a disinfectant. The Minister's representative thought that soap was the best keratolytic and that 1% of hexachlorophane would not be enough to be effective as a disinfectant.

"We do not know," the report concluded, "how Drox shampoo is normally used. The manufacturers say it has not been advertised to the public for some years. Our medical members think it is the word 'shampoo' which disturbed the Minister, but there are many shampoos in the *British Pharmacopoeia.* Soap is often the best vehicle for administering a medicament to the skin. Hexachlorophane is a powerful disinfectant, and 1% should have been sufficient for this case, and the doctor might well believe that the other ingredients would help in removing the scales. We decide that this Drox shampoo was a drug which the executive council was bound to provide."

No Defence

In another case Drox shampoo had been prescribed for a patient suffering from seborrhoea of the scalp. The doctor who prescribed it said his only defence was that it had been recommended by a consultant dermatologist. The referees said that that was no defence at all. In their report to the Minister they wrote: "It is for the doctor, not the consultant, to decide what can be ordered at the expense of the executive council. If this patient had seborrhoea of the scalp there would be scales on his head which would have to be removed before the application of any remedial preparation. Some disinfectant would also be needed. Our medical members think that both these purposes would be served by the special composition of Drox shampoo, and this is what the consultant had in mind. The doctor should pay more attention to the Standing Joint Committee on the Classification of Proprietary Preparations."

The referees decided that this was a drug that the executive council was bound to provide.

In the third case, in which Drox shampoo had been prescribed for dandruff and alopecia, the referees decided that it was not a drug the executive council was bound to provide. They commented: "We have before us the composition of Drox shampoo. Our medical members are unable to find in it anything which would be of any value in the treatment of either dandruff or alopecia except, of course, that cleanliness is always conducive to health. The local medical committee seem to have based their decision on the advice of the consultant, but consultants often advise treatment which executive councils are not bound to provide. It is for the doctor to decide what his terms of service authorize him to order at the expense of the executive council. A doctor who disregards the advice of the Macgregor Committee must be prepared to give much more information than we have in this case."

Ethisan

The referees, disagreeing with the local medical committee's opinion, decided that Ethisan shampoo was not a drug which the executive council should provide in a case of psoriasis of the scalp.

In their report the referees stated that Ethisan shampoo contained 0.938% of lanette wax and 6.56% of sodium lauryl sulphate, and was recommended by the makers for use in the treatment of the scalp as a cleaning agent. The referees did not know what local application was intended. Sodium lauryl sulphate was a detergent and their medical members knew of no treatment for psoriasis for which a detergent would be an essential requirement. The referees concluded: "If the doctor had read the report of the Standing Committee on the Classification of Proprietary Preparations he might have been more cautious about ordering shampoos at the expense of the executive council and told the patient to buy it himself."

---

* These findings are normally sent only to the interested parties. They are sent by the Ministry of Health to the *B.M.J.* with all names deleted.

Johnson's Baby Cream

A decision by a local medical committee that one tube of Johnson's Baby Cream for a patient with inflammation of the groins and buttocks was in that particular case a drug bound to be provided by the executive council was affirmed by the referees.

In their report the referees said that the mother had tried several preparations but found the cream more effective than other remedies. It contained 35% white oil, 5.6% anhydrous lanolin, and 0.2% hexachlorophane. The Minister's representative said the inflammation had probably been caused by infrequent changing of the napkin or by the napkin being covered by a waterproof material. He maintained that the mother was responsible for the inflammation and that she should have paid for the remedy.

The doctor had taken no part in the choice of the remedy. She had given the prescription only because the mother asked for it. The representative of the local medical committee said that its decision had been based on a passage in Sheldon's textbook on diseases of children which said that the affected parts should be freely smeared with a protective layer of grease to avoid further contact between the urine and the skin and so prevent the continuance of the inflammation.

"On the balance of probability," the referees concluded, "it seems to us that we should accept the Minister's representative's version of what really happened between the mother and the doctor, but there is one person who has so far been overlooked. The baby, through no fault of his own, suffered from a painful inflammation which he was entitled to have treated by the National Health Service whether by way of prevention or alleviation. Our decision will make no difference to this baby, but there is a principle involved which might affect other babies. The doctor may not have acted strictly in accordance with the traditions of her profession, but we do not think we ought to make her pay for this prescription just because she followed the advice of the mother, who, in this case, was in a better position to judge the efficacy of the remedy. We affirm the decision of the local medical committee."

"Alphabet of Opportunity"

The B.M.A. Career Service's "alphabet of opportunity" gives a list of the various specialties in the field of medicine open to a newly qualified doctor. This new service, under the direction of Dr. R. A. Pallister and Dr. A. Gilmour, aims to supply the Association's younger members with any factual information they may need when planning their future career.

The medical directors point out that a young doctor may ask about, for example, terms and conditions of service or about opportunities for vocational training in one or another branch of medicine. He may want to know the best way of entering a particular specialty, and the number of future vacancies there are likely to be in it. The Association's Career Service will provide the answers, and will if required interview the inquirer and put him in touch with senior colleagues in his region who will give individual advice on a career and on the right training for it. The advisers will normally be associated with medical schools or colleges, with whom the Association will closely co-operate.

For doctors seeking information about postgraduate diplomas, there are separate information sheets for each specialty listing the postgraduate diplomas obtainable and giving details of the licensing bodies, regulations for the examinations, and places providing courses of instruction, together with details of fees.

The service is open to inquiries on any matter related to a medical career. It is hoped to extend the service in due course to schools, for the benefit of school-leavers who are considering medicine as a career.

Particulars about the service may be obtained from the Medical Directors, B.M.A. Career Service, B.M.A. House, Tavistock Square, London W.C.1.

Medical Assistants in Scotland

The Scottish Home and Health Department has stated that all medical assistants in Scotland who have been transferred from posts of unlimited tenure in the junior hospital medical officer grade will be regarded as having been appointed to the medical assistant grade as from 1 November 1964.

Any doctor who held an appointment of limited tenure immediately before becoming a medical assistant will be assimilated to the medical assistant grade as from the day after the date of expiry of his last completed year in his previous grade.

The Scottish Home and Health Department has authorized regional hospital boards to make the necessary retrospective adjustment and to pay the arrears of salary to those concerned.

Vocational Training for General Practice

At its meeting on 7 September the General Medical Services Committee debated a report on vocational training for general practice by its Advisory Committee on Vocational Training and Continuing Education for General Practice.[*] *The Advisory Committee was asked to reconsider some parts of the report in the light of the debate, but it was decided that in the meantime a copy of the report, as representing in general the G.M.S. Committee's views, should be sent to the Royal Commission on Medical Education and to the Central Committee on Postgraduate Education.*

A summary of the Advisory Committee's conclusions is printed below. A report of the G.M.S. Committee's debate on vocational training and on the other items on its agenda will be printed next week.

Summary of Committee's Conclusions

The report stated that, in order to fulfil his role of general physician to the community, the general practitioner of the future must have adequate vocational training after full registration and before becoming a principal. The vocational training must differ fundamentally from the present Trainee General Practitioner Scheme, and it must be adaptable to rapidly changing needs.

The Advisory Committee believed that vocational training should be a part of modern medical education, regardless of specialty or discipline, and that a planned programme of career training could provide a strong inducement to graduates of the right calibre to enter general practice. It thought the responsibility for vocational training should be vested in the Central Committee of Great Britain for Postgraduate Medical Education, which "will no doubt wish to conduct its operations through regional organizations."

Hospital Training

The Committee advocated a minimum of three years spent in whole-time hospital appointments, or their part-time equivalent, after qualification. Appointments should provide clinical experience in those subjects of particular importance to general practice, and a system of rotating appointments was proposed.

Hospital experience gained outside the United Kingdom, paid part-time hospital appointments, and further experience in greater depth should constitute an acceptable part of vocational training for general practice, it was thought.

General Practice Training

In the Committee's opinion whole-time in-service training in general practice for at least one year was essential. In-service general practice training posts should be known as "general practitioner registrarships," and the title "general practitioner teacher" was suggested to replace "trainer."

A general practitioner teacher should be entitled to a substantial increase in remuneration. Before a teacher is appointed his practice as a whole must be approved. Partners must "be prepared to collaborate in training programmes and they and the candidate [teacher] must be of good professional repute."

Approval of appointment as a teacher, the Committee thought, should be provisional for the first year. Substantive appointment should then be for a period of five years, and renewable thereafter on a five-yearly basis, subject to approval. Teachers should be required to study teaching methods and to undertake special commitments in continuing education.

Registrarships

The Committee regarded one year as the minimum term for a registrar's appointment to a teaching general practice. The registrar "should have clinical responsibility for patients as soon as possible." He should be afforded the opportunity of visiting different types of practice.

Registrars should learn about the administration of general practice, of local health authority services, of Government departments, and of voluntary services and the occupational health service. The Committee also thought there was a need for close integration of the hospital and the general practice components of vocational training.

University Departments and Postgraduate Centres

The Committee thought the development of university departments of general practice should be encouraged, and they should be intimately involved in vocational training.

Registrars should have close contacts with postgraduate medical centres. The Central Committee of Great Britain for Postgraduate Medical Education should be responsible for the administration of vocational training for general practice in the same way as for other types of postgraduate medical education.

A general practice subcommittee of a regional postgraduate committee should be formed to oversee, in conjunction with all interested bodies, vocational training for general practice. Its members should be drawn largely from local medical committees in the region and from the Royal College of General Practitioners. The Committee stated that the regional general practice subcommittee would require the services of a regional adviser in general practice to act in conjunction with the postgraduate dean. In some cases a district executive officer would be required.

Pay During Training

A doctor's remuneration, the Committee held, should increase in accordance with his expanding general professional experience within a vocational training programme.

The rate of the existing vocational training allowance was inadequate and must be increased.

A standing advisory body, whom the Minister would consult about individual cases relating to the assessment of the criteria for the vocational training allowance, should be set up immediately. In future, however, that function should be the responsibility of the regional subcommittee, and appeals from its decisions should be decided by the standing advisory body.

---

[*] The members of the Advisory Committee are: Mr. D. C. Bowie (chairman), and Drs. J. C. Cameron, P. W. R. M. Alberti, P. S. Byrne, Joan Chappell, A. Elliott, D. G. Emery, W. W. Fulton, J. P. Horder, R. A. Keable-Elliott, G. Murray Jones, G. Swift, D. B. Wallis, M. A. Wilson, and H. S. Howie Wood. Previous members of the Committee at the time when the report was being prepared were: Drs. J. R. Bennett, A. B. Gilmour, and J. S. Noble.

Better Medical Care

The Edinburgh and South-east Scotland Branch of the B.M.A. is arranging a conference on "Better Medical Care—Which Road?" The conference will be held on 7 October in the David Hume Tower, University of Edinburgh (George Square). Any doctor may attend, and a programme and registration form (registration fee 5s.) may be obtained from Dr. H. P. Dinwoodie, B.M.A. Scottish House, 7 Drumsheugh Gardens, Edinburgh 3.

Dr. A. D. Mitchell will take the chair at the morning session, which is to be on "The Present Position—Advantages and Disadvantages." The theme of the afternoon session (chairman, Dr. John Riddell) will be "The Future Organization of Medical Care," and that of the evening session, at which Dr. S. J. Hadfield will preside, will be "The Financing and Administration of Medical Care."

Hospitality

A French doctor living in Marseilles would be pleased to receive an *au pair* from 1 October for 10 to 12 months. The doctor has two sons, aged 17 and 16, and a daughter aged 10 years.

A French doctor living in Nice would like his daughter aged 19 years to stay *au pair* with a British medical family from December 1968 for six to eight months.

Would anyone who is interested please get in touch with Dr. R. A. Pallister, Medical Director, International Medical Advisory Bureau, B.M.A. House, Tavistock Square, London W.C.1.

B.M.A. Nuffield Library

The Library service is available to all members of the Association resident in Great Britain and Northern Ireland (and by special arrangement to members of the Irish Medical Association). A copy of the library rules will be forwarded on application to the Librarian at B.M.A. House.

The following books have been added to the Library:

H.M. Forces

Appointments.—Group Captain H. A. N. Hamersley (deputy principal medical officer (H), Headquarters Air Support Command); Group Captain I. M. O'Connor (ophthalmic duties, R.A.F. Hospital, Wegberg, Germany); Wing Commander B. K. Wharton (neuropsychiatry duties, R.A.F. Hospital, Wegberg, Germany); Wing Commander J. I. Cromarty (exchange posting, Royal Australian Air Force).

ARMY

Colonel G. F. Valentine, late R.A.M.C., has retired on retired pay.

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel R. J. C. Hart has retired on retired pay.

Majors O. M. P. Tobias and D. S. Hutton to be Lieutenant-Colonels.

TERRITORIAL AND ARMY VOLUNTEER RESERVE

ROYAL ARMY MEDICAL CORPS

Major C. Dulake, from T.A., to be Major.

Association Notices

Armed Forces Committee
Nomination of Members for Co-option

The constitution of the Armed Forces Committee was amended at the Annual Representative Meeting of the Association in Bristol in July 1967 to allow greater representation of serving medical officers, especially younger members, by means of co-option to the Committee. It is now open to the Committee to co-opt two representatives, of the rank of major or equivalent (lieutenant-commander or squadron leader) or below, one of whom should preferably be of specialist status, from the medical branch of each of the Services.

Serving medical officers are therefore invited to nominate members of the Association in the armed Forces in these ranks for co-option to the Committee.

Nominations should be sent to the Secretary of the Association by 30 September 1967. The first meeting of the Armed Forces Committee, at which co-opted members will be appointed, will be held in the autumn, and after it nominees will be informed of the appointments made.

DEREK STEVENSON,
Secretary.

General Medical Services Committee

Vocational Training for General Practice

The G.M.S. Committee discussed at length vocational training for general practice. Its advisory committee's report on the subject was presented by Mr. D. C. Bowie, the advisory committee's chairman. A summary of the conclusions in the report was printed last week (Supplement, 16 September, p. 129). The G.M.S. Committee approved the report in general and decided to send it to the Royal Commission on Medical Education and to the Central Committee on Postgraduate Medical Education. The advisory committee is to amend its report in the light of the G.M.S. Committee's debate, and particular attention is to be drawn to the G.M.S. Committee's concern that doctors who receive a vocational training for general practice should have available to them when they enter practice the necessary facilities to make effective use of their skills. See leading article at page 754.

The general practitioner's case at the next review of doctors' pay by the Review Body is to be presented by counsel. The memorandum of evidence is to be published but not the oral evidence.

A meeting of the General Medical Services Committee was held on 7 September, with Dr. J. C. CAMERON in the chair.

Advisory Committee's Report

Mr. D. C. BOWIE, chairman of the G.M.S. Committee's Advisory Committee on Vocational Training and Continuing Education for General Practice, introduced its report on vocational training for general practice.

Mr. Bowie referred to three current events of importance in medical education. The first was the setting up of the Royal Commission on Medical Education, which was due to report within the next six months. It would probably set the stage for medical education for the next 20 to 25 years. The second was the formation, by the joint action of the universities with medical schools and the medical colleges in England and Wales and in Scotland, of the Central Committee on Postgraduate Medical Education. The third was the publication of the General Medical Council's Recommendations on Basic Medical Education.

The General Medical Council had divided medical education for all doctors into four periods. These were (1) premedical education; (2) basic medical education (up to and including the pre-registration year); (3) vocational training; (4) continuing education.

Mr. Bowie quoted from the G.M.C.'s report: "The time is approaching when it will be necessary to identify programmes of training for each of the vocational branches of medicine, including general practice, and to arrange by an extension of the Medical Act for some form of official recognition to become available, such as the inclusion of names in a vocational register, for individual doctors for their selected careers in medicine." The sort of vocational register the G.M.C. had in mind was to be informative and not restrictive. On educational grounds, the G.M.C. had stated it would welcome the introduction of vocational training schedules.

Sources of Vocational Training

Mr. Bowie said that his committee's report was couched in general terms. The details would have to be worked out later. Contributions to vocational training could come from four sources. The first was from the hospital services, because it was there that concentrated experience in a reasonably short space of time could be had. The second was from university departments, and these included departments of general practice. The report advised that departments of general practice should be set up in all medical schools—the aim being to present the general-practitioner point of view in clinical situations to undergraduates at their impressionable periods, and to present them with a picture of good general practice, so that they would think of general practice as a career.

The third source of vocational training was general practice itself, by a modification of the existing trainee scheme. Mr. Bowie said he was glad that the trainee scheme, with all its imperfections, had survived, because it was now available for modification. The fourth source of vocational training was the local health authority services.

That these four sources of vocational training came under independent and separate authorities could create difficulties. The administration of vocational training for general practice should, like vocational training for other careers in medicine, be vested in the Central Committee on Postgraduate Medical Education. In this way general practitioners would be ranked with their colleagues and would have equal rights and equal claims on such a body. Such a national organization had to be sensitive to local needs and problems, and the report suggested various ways in which general practitioners could exercise their influence on regional bodies. There was a suggestion for general practice second-year registrarships, and that they should be elective.

As regards remuneration during training, a scheme was proposed whereby increasing general experience would be rewarded by increasing pay, even when the trainee moved to a department to which he could bring no particular previous experience.

Mr. Bowie concluded: "Even the improved rates of pay during training which are advocated [in the Committee's report] will fall below what doctors can currently expect to earn as assistants or as principals in general practice after little, if any, true vocational training. The rate of vocational training allowance now payable is far below what is needed even to make up the deficit for a doctor who has prepared himself conscientiously for his career. . . . Vocational training is, in effect, obligatory for doctors before they can secure appointments in specialist hospital practice. The general pattern is determined by the training requirements of the colleges for their specialist diplomas and by advisory appointments committees when electing applicants to consultant posts. If inducement payments, in the form of vocational training allowances, are to be the only incentives to vocational training for general practice the rates will have to be multiplied many times before these are effective. We suggest that standing advisory bodies should be formed to help to determine whether a scheme of vocational training measures up to what is desirable.

"Lastly, the report says that there is ample room for research and evaluation of different methods. We have not come forward with any single method [of vocational training], but we advise that if a scheme is accepted there will be variations throughout the country, and it will be desirable to evaluate them in order to progress"

General Debate

Dr. H. S. Howie Wood said that everybody was "having a go" at legislating for the doctor's first year or two after qualification, and it was fitting that the G.M.S. Committee should produce its own valuable contribution. As a trainer himself he was glad to see the proposal for co-operation between the hospitals and the local medical committees. He welcomed the role which the regional committee would play. Local medical committees should see to it that the training scheme did not become so educational that it lost touch with reality.

Dr. J. S. Happel thought it important that the responsibility for vocational training should be vested in an educational rather than a service authority. This was particularly the case in general practice, where the authority would have to co-ordinate contributions to vocational training from a number of independent bodies. The G.M.S. Committee would undoubtedly wish to be represented on the new committee. The advisory committee believed that a teacher must be appointed for long enough to encourage him to prepare himself seriously for his duties. It proposed that approval of the teacher should be provisional for the first year during which a registrar was attached to the practice, and it should then be reviewed. If the regional subcommittee was satisfied, and the teacher was prepared to continue, he would be reappointed for five years, and thereafter his appointment would be renewable on a five-yearly basis.

Dr. Happel said that five years was too long. The paragraph in the report as it stood was too weak. So many things could happen in respect of the personal commitments of the trainer and of his health, and Dr. Happel believed that the appointing committee should require some annual statement on these matters from the trainer. Mr. Bowie had mentioned the General Medical Council's recommendation of a vocational register. Did that mean, asked Dr. Happel, that only those general practitioners who had undergone vocational training would be principals on the register? Would those who had not undergone training become "medical assistants?

Local Control

Dr. A. Reeves commented on another report before the Committee entitled "A Future Trainee General Practitioner Scheme," which resulted from two separate two-day studies of the general practitioner trainee scheme organized by the British Postgraduate Medical Federation. The studies were directed to the community aspects of the work of general practitioners and the medical content was omitted. One of the conclusions was that organization should be in the hands of regional bodies engaged in postgraduate education in the other branches of medicine. Dr. Reeves thought there was a danger of general practitioners losing local control of their own affairs as a result of that suggestion. The scheme in his area, the West Riding, was proving effective, because the committee knew the trainers and knew the background. He hoped that the local element would be retained.

Dr. W. W. Fulton spoke as a member of the advisory committee, and he said that one of the difficulties facing it had been to decide on what the general practitioner of the future would be like. The committee's ideas had been vague. General practice was changing so rapidly, and therefore to try to say how general practitioners should be trained in future was a more difficult task than it would be for other specialties.

When it came to what the doctor should learn there had been more agreement, and in particular Dr. Fulton commented on the agreement between the representatives of the different bodies on the committee—the Royal College of General Practitioners, the B.M.A., the G.M.S. Committee, and the G.M.S. Committee (Scotland). The main point on which agreement had to be reached was the administration of a training scheme. In the other specialties the appropriate college set the standards. In general practice that had only just begun, and there was a long way to go. The standards were being set by the Royal College of General Practitioners, but there were very few university departments of general practice and there were practically no facilities for postgraduate vocational training for general practice.

Educational Responsibility

The advisory committee thought that the administration of the training scheme must be of an educational rather than a Health Service character, said Dr. Fulton, because there was inherent in the situation the dilemma that the needs of the Service, to provide medical care for patients, tended in the eyes of the Ministry of Health to be paramount. The Ministry must recognize that the N.H.S. had an obligation to provide vocational training for general practitioners as it had for hospital doctors. The committees responsible for this—nationally, regionally, and locally—must be educational committees, but Health Service administrative bodies must be represented on them, particularly regionally and locally. One of the difficulties would be to ensure that the hospital service would accept responsibility for the hospital part of the vocational training of general practitioners. Responsibility for training specialists was easily acceptable to hospitals, but it was more difficult for them to accept responsibility for others. Hospital authorities must be represented on the committees. Responsibility for the scheme should not be handed over to university departments.

The Health Departments, Dr. Fulton continued, would have to allocate money for educational purposes in the hospital service as well as in general practice. The Ministry must encourage experiments, and it was the G.M.S. Committee's job to push the Ministry to start doing something somewhere.

It was perhaps not for the advisory committee to say that there should be obligatory training for general practice, or to say that a doctor could not practise as an independent principal until he was recognized as a specialist in general practice. The time for that might be coming. The responsibility of the G.M.S. Committee was to say to the Ministry, "If there is to be an interim phase you must ensure that people who go through this vocational training are adequately recompensed for having done so." It was up to the G.M.S. Committee to ensure that.

New Concepts

Dr. A. Elliott said it seemed that the advisory committee and the General Medical Council and other bodies were thinking along the same lines. The G.M.C.'s recommendations were forward-looking. The concept of training was different from what it used to be. The idea used to be that a man became a "doctor" the day he got his diploma. It was interesting that mathematics were now part of medical training, because a knowledge of statistics was essential, and there was also training in psychology and sociology. Before a full vocational training scheme could be implemented there was a need to educate teachers, and that could not be done overnight. There were traditions in medicine which had been current for 150 years. It was up to the G.M.S. Committee and local medical committees to fight for the new concepts.

Dr. M. Goodman said that so long as general practice was the only subject to be left out of the undergraduate curriculum it would not command respect from prospective entrants. However, if university departments in general practice were created they must not be treated in the same way as other departments in the university sometimes were, with professors arguing over how many hours their specialty should be allocated.

General practitioners who were teachers would not have time to attend so many patients as before, and their lists would be smaller. Any payment to teachers would have to be commensurate not only with their skill but also compensatory for their smaller list. The committee selecting the teachers would have to learn by experience who made good trainers, and perhaps at the end of a certain period it would have to look at their work.

Lengthier Training

Dr. A. Speakman believed that every doctor should spend a period in general practice. Another aspect of a vocational training scheme was that it lengthened a doctor's period of training. The age of maturity was falling, and more and more undergraduates wanted to get married. They were not going to wait another four years before starting to earn their living. It was important that the social effects of a vocational training scheme should be considered. People must not be discouraged from entering general practice by the prospect of a prolonged course of training before they could settle in the job they wanted to do and in the circumstances in which they wanted to do it, with a wife and family. A trainee's pay should increase during his training so that he could live a normal social life.

Nobody but a general practitioner of experience should teach general practice, continued Dr. Speakman. One of the paragraphs in the report read:

> General practitioner teachers must be experienced principals who can combine their skill in domiciliary care with high standards of scientific medicine in the treatment of patients in the community they serve. Those who hold clinical appointments in other parts of the Health Service should be well placed for approval. Originality not amounting to eccentricity and enterprise are valuable qualities. Some general practitioners may have had experience of teaching medical students or junior doctors holding hospital appointments, and others may be teaching in some related field—for example, in health education. Evidence of original work and thought, the possession of certain higher qualifications, and participation in research projects should all be considered in the case of a doctor aspiring to become a general practitioner teacher.

These, said Dr. Speakman, might be called the criteria for those who wished to become general practitioner teachers. However, teaching was an art, and not everyone had that gift. "We must find a method whereby we can detect the good general practitioner who will be able to give to his trainee the results of his own experience and be able to put it across in the proper manner. None of these criteria necessarily imply this. On the other hand, we must be careful not to eschew those people who have none of these qualifications. There are many general practitioners who get on with their work quietly, and do the job excellently, but they do not get their names in print or get letters after their names. Yet they would be excellent teachers, because they are basically sympathetic to human problems, and training is a human problem."

Teachers' Pay

The teacher was entitled to "a substantial increase in remuneration." Dr. Speakman said he was not yet convinced as to the justification for the words "substantial increase in remuneration." Obviously the teachers would have to be subsidized, because they would have a smaller list. But he was not convinced that somebody who did less work should receive a substantial increase in remuneration *per se*.

Dr. Speakman agreed a teacher should get extra pay for an onerous and responsible task. But where should the money come from? If the "substantial increase in remuneration" was based on the existing method of payment Dr. Speakman said he foresaw trouble. If the Review Body was asked for extra money to pay doctors who were going to be teachers, and whose qualifications fulfilled certain criteria, the Review Body might say that these payments were merit awards "coming in by the back door." Dr. Speakman suggested that the extra remuneration for general practitioner teachers should come from the funds of the educational authority, and must be unrelated to the payments for general medical services which were negotiated with the Review Body. Then there could be no quibble, and nobody could say that these doctors were taking money which other doctors might have got.

Some Questions

Dr. Speakmen asked for an assurance that, if the suggested vocational register became mandatory, qualification for admission to the register would not be made retrospective—that was, that doctors who had been qualified for years should have to become trainees before they could be put on the register. Secondly, he wanted to know what a department of general practice was going to do. Was it going to be purely administrative? Was it going to be educational, and, if so, what could be taught in a department of general practice that could not be taught in a surgery? One could not learn in a university how to cope with personal problems.

Dr. Speakman also wanted to know what would be the function of the Royal College of General Practitioners. He was not implying any criticism of the College. It was said that it would be on an equal basis with local medical committees in forming the regional bodies. However, he did not consider it wise for a body which did not represent all general practitioners to be on an equal basis with local medical committees on the regional subcommittees. There had to be a happy marriage between the service departments and the educational departments, but the college was primarily an educational body, and he hoped that it would not have *carte blanche* to run the subcommittees. It was the local medical committee, the service side, that should have the final say.

Finally, the remuneration of the trainee would have to be increased during the long period of training, but that would mean that he was a salaried general practitioner. His pay would be laid down on a scale. If a doctor was salaried at the beginning of his career there was a danger that the Ministry would try to carry that over into his eventual method of payment.

Access to Hospitals

Dr. D. L. WILLIAMS believed that the worst corrosive influence on the morale of general practitioners was their inability to practise the skills which they had been taught in a training which had been mainly orientated to the hospital service. Yet here was a proposal for another two years of hospital training. Therefore the policy put forward in the report could be justified only if it was believed that general practitioners in the future were going to have direct access to the district general hospital, that they were to have hospital privileges commensurate with their training, and that they were going to be able to look after their own patients in hospital with full clinical responsibility, subject to the availability of specialist advice.

Dr. Williams went on: "If we believe that, then this report is right. But if we believe that, then we are proposing a hospital revolution, and if we are proposing a hospital revolution then the younger doctors will want to know that that revolution is going to be successful before they put two years of their lives in pawn. It would be irresponsible for this Committee to approve a further two years' training unless we clearly put in this document the changes which we think ought to take place in the hospital service before those extra two years are put into force. When we trained as doctors we had in mind what we were going to get when we finished. A general practitioner undertaking vocational training will want to know what he will get as a result of that vocational training in the way of extra rights and privileges."

Paragraph 5 of the report, said Dr. Williams, read as follows: "Vocational training is thus an essential part of the preparation for a career in any branch of medicine, and doctors who wish to enter general practice will have to undergo an acceptable programme of training after full registration. The Committee supports this principle."

Dr. Williams put forward an amendment, to add the words:

> "It is equally essential that doctors who complete a programme of training should have ample opportunity to use the additional skills they have acquired. In particular, they should enjoy hospital privileges commensurate with their training, including the right to attend their own patients in National Health Service hospitals, exercising full clinical responsibility and calling for the advice and help of specialist colleagues when necessary. Agreement on the detailed application of this principle should be reached before any formal scheme is introduced, in order to clothe vocational training with suitable academic and clinical incentives."

Probationary Assistant

Dr. Williams said he thought there was too quick a move from too little vocational training to too much. He believed there ought to be a method of combining the "assistantship with a view" with the trainee year as an alternative to the trainee scheme as such. For that reason he suggested a new paragraph headed "Alternative Arrangements for First Trainee Year." Some doctors might not wish, for family or other personal reasons, to postpone too long their final entry into practice and might wish to combine the first trainee year with a probationary assistantship with a view. That arrangement would be approved only where the practice concerned would have been eligible for appointment as a teaching practice. The assistant would receive the training normally given in a teaching practice, and, in addition, would be released on one day in each week to attend an organized vocational training course at a regional centre. He would be paid and employed by the practice as an assistant with a view, but the executive council would refund the proportion of his salary and expenses attributable to attendance at the training course.

Dr. Williams thought that, with the shortage of doctors and with emigration, any mention of compulsion for vocational training was farcical. Furthermore, he did not believe that it was right to compel the majority to do what a minority at the moment were doing—he was referring to the trainee practitioner scheme, where the numbers had been falling.

Dr. Williams thought that in places there was a "whiff of paternalism" in the advisory committee's report. One paragraph he would like to see deleted read: "While a doctor who had held a satisfactory series of hospital posts outside the vocational training scheme might be accepted for the general practice component of vocational training, the regional subcommittee should be satisfied that his application was genuine, and not, for example, merely to obtain finance and time to study for examinations for some other career." The regional subcommittee would have to be satisfied about his motives, and if officialdom did not approve of the method by which a doctor had gone about things then his motives must be questioned. Dr. Williams believed that that was a wrong approach.

There was another paragraph which read: "The Committee advises that when a doctor is accepted into a vocational training programme for general practice his remuneration should increase in accordance with his expanding general professional experience, irrespective of where, or under which employing authority, he may be working. This should provide an inducement for young doctors to prepare themselves properly for careers in general practice." That meant, said Dr. Williams, that experience in breadth and not in depth should entitle a trainee to an increase in salary—but again only when officialdom had approved the method by which he had gone about things. That would differentiate between those who were approved and those who were not, though the posts held might be comparable. That was nonsense. The words "when a doctor is accepted into a vocational training programme for general practice" should be deleted, and all doctors should have an increase in salary according to the breadth as well as the depth of their experience.

Approval of Conference

Dr. R. B. L. **Ridge** said that the reason why most reports on general practice gathered dust on shelves was because they were a step removed from reality, and the gap between what was proposed and what obtained was too wide. The reason why he particularly welcomed the advisory committee's report was because the gap between what was proposed and what obtained today was not too wide. However, before it could become policy it would have to receive the approval of the Conference of Representatives of Local Medical Committees.

Dr. Ridge referred to a proposal in the report that the regional general practice subcommittee "should be charged to procure, in conjunction with all interested bodies, a system of vocational training for general practice within the hospital region. The chairman of the regional committee and the postgraduate dean should be members *ex officio*, and the majority of members should be drawn from local medical committees and the Royal College of General Practitioners. University departments of general practice, the regional hospital board, and the executive council should also be represented." The scheme was to replace the existing trainee practitioner scheme. Local medical committees should continue to have a place in the new scheme, and therefore Dr. Ridge suggested that the paragraph should read, in the second sentence: "The chairman of the regional committee and the postgraduate dean should be members *ex officio*, and the majority of members should be drawn from local medical committees. The Royal College of General Practitioners, university departments of general practice, the regional hospital board, and the executive council should also be represented." Dr. Ridge said that if that alteration was not made he could see little prospect of the scheme receiving the support of the Conference.

To some extent the success of the scheme depended on the existence of departments of general practice in teaching hospitals. There were already one or two, but before they were established in every teaching hospital there had to be a great change in the climate of opinion. That would take a longer time than could be afforded to get the scheme started. Therefore Dr. Ridge hoped that the advisory committee would look at its report again to see to what extent the scheme could be brought into effect without necessarily having to rely on departments of general practice in teaching hospitals.

Dr. Ridge thought that there should be reconsideration of the proposal that there should be no appeal open to a doctor whose application to become a general practitioner teacher failed. Since the appointing committees would have the power of appointment they would also have the power of approving extra remuneration. In every other aspect of remuneration the G.M.S. Committee had always insisted that there must be an appeal machinery. It was noteworthy that in another paragraph of the report it was suggested that there should be appeals from the decisions of the regional subcommittees' assessments of the criteria for a vocational training allowance.

If the concept embodied in the report could be brought to fruition, concluded Dr. Ridge, it would do as much as, if not more than, anything else which the G.M.S. Committee had attempted to enhance the status of general practice.

Diploma in General Practice

Dr. G. **Murray Jones**, a member of the advisory committee, said that one of the reasons why newly qualified doctors suspected general practice was because of the ease with which they could go into it, and earn a fairly substantial income, compared with the difficulty in specializing.

He believed that a man who really believed that general practice was a specialty should be prepared to take a diploma in it. There was no reason why general practice, if it was a specialty, should not have a diploma or a higher qualification, when every other specialty had one. In answer to the question on what departments of general practice did, Dr. Jones said that they did the same as departments in other specialties—the professors organized the undergraduate and postgraduate education of students, and that was a gigantic task.

Dr. B. D. **Morgan Williams** commented on posts in hospitals for trainee general practitioners. The G.M.S. Committee should beware of what used to be called supernumerary posts, in which doctors had no clinical responsibility. Without responsibility there was little learning. He also commented on whether the teacher should be appointed for five years or less, and he thought it should be for, say, three years. Trainees should be asked to report each year to the local medical committee on what they had learnt.

The report proposed that when regional subcommittees appointed registrars to teaching practices the teachers concerned must be invited to take part. Dr. Williams wondered how any principal could be expected to take a trainee without appointing him personally or at least having some veto over the prospective appointment. If a principal was legally responsible for what a trainee did he must have the power to dismiss him. Dr. Williams thought that three years in hospital posts after qualification was too long. One preregistration year and a second year, perhaps in rotating appointments, was right, but not a third year. One of the attractions of general practice was that a man could be his own boss before he was 30 years of age. The age of responsibility should not be postponed further and further.

Training Course

Dr. D. B. **Wallis** drew attention to the need for training teachers, and mentioned the course that the Department of Adult Education in the University of Liverpool was running for a group of doctors who wanted to be trainers. They were shown the different teaching methods such as tutorials, one-to-one teaching, formal lectures, and the use of visual aids.

Dr. T. J. **Carter** suggested that a report on the report was needed to find out how many of its proposals were practicable. Would it be possible to find sufficient trainers of the calibre suggested? Would it be possible for doctors to find appropriate posts in hospitals over the three years in which they would be engaged in their training? What would be the time lag before these things were available? There should also be some way for young doctors to be put in touch with trainers, and an attempt should be made to help doctors to plan their training period.

Dr. H. N. **Rose** said that the report envisaged the upgrading of general practice and it told people how to become good general practitioners. There was an inference that in the future those who had not had a vocational training would not be good general practitioners. If a register was kept of doctors who had had this training there would be two classes of general practitioner.

Dr. Rose continued: "We are faced with the problem of whether in the future this should be mandatory or not. Can we expect people to undergo a course of training which is going to last eight or nine years before they can be recognized as good general practitioners? I think at the moment that this is pie in the sky." The scheme was a good scheme, but the realities of the situation had to be considered. There were too few doctors. If newly qualified doctors were asked to undertake this prolonged period of vocational training the general-practice work load would increase and the number of general practitioners would decrease. Was it possible to have perhaps a temporary scheme until there were more doctors? Dr. Rose suggested that, in addition to the preregistration period, there should be a period of perhaps three to six months in which doctors could learn the attractions of general practice. There could then be rotating clinical assistantships in hospitals, which would be mandatory, and they would attract a vocational training allowance. In that way they would continue to work in general practice and there would be no depletion of medical manpower.

Dr. Rose also pointed out that between 600 and 1,000 trainers would be needed for the proposed scheme, and if it was put into operation a crash training scheme for teachers would be required.

Idealistic Scheme

Dr. G. Cormack thought that the scheme was an idealistic one put forward by idealists. It was good to have idealists, but he was worried about one of the fundamental assumptions in the report: "The effectiveness of the contribution of new general practitioners will depend upon the adequacy of their training, while this in turn will increase the attractiveness of general practice and so improve recruitment."

Dr. Cormack said that the truth of that statement should be looked at in relation to what general practice consisted of for so many doctors today. A highly intelligent man or woman who trained for six years and then did three years' compulsory vocational training would turn out an exceptional member of the community. Were they to be expected to go to an industrial practice where they would spend most of the day signing certificates for people to stay off work? That was the anomaly of the scheme. It could not be considered in isolation from the nature and structure of general practice as it existed now in the N.H.S.

Dr. Cormack thought that the recommendation that a trainee should attend outpatient sessions in psychiatry for a year or hold a three months' house appointment was stretching it too far. The report stated that many general practitioners did not wish to practise obstetrics, in the sense of undertaking responsibility for confinements, but they would have an important function in shared antenatal and postnatal care and must "have had sufficient training to enable them to act appropriately in an obstetric emergency." Dr. Cormack submitted that any doctor who did not practise obstetrics should not do antenatal or postnatal care, because he was incompetent to do it.

Dr. B. E. P. Wookey agreed that obstetrics was an integral part of general practice, and every general practitioner should do it. A minimum of six months in obstetrics should be fundamental to the vocational training scheme.

Much depended on whether the scheme was going to be obligatory. He did not believe that a vocational training allowance would be an incentive, because those who were keen to be general practitioners would in any event take a course of training. To increase the attractiveness of general practice it was necessary to raise the bottom as well as to encourage the top.

Dr. Joan Chappell, a member of the advisory committee, said that medical teachers and the representatives of the colleges would have to be persuaded that a medical school could not function properly without a department of general practice. A department of general practice would make a contribution to the teaching of undergraduates, giving them some idea of general practice and of its administration. It would undertake research; it would also teach teachers; and one of its more subtle functions would be to teach the teachers in the other departments of the medical school. It was necessary to go ahead swiftly with a scheme for vocational training in general practice, and thus make a positive contribution to medicine.

Essentials for General Practice

Dr. E. Townsend welcomed the report for the very reason that it was an idealistic report. It was something to aim at. In 1962 Cornwall had put forward a motion to the Representative Body asking that all the necessary facilities for diagnosis and treatment should be provided for general practitioners. The motion had been lost. General practitioners now had ancillary help, and the next thing they must get was hospital beds and full diagnostic facilities. They were essential if general practice was to survive.

Dr. Townsend suggested that the postgraduate education committee should be represented on the regional general practice subcommittee. The postgraduate education committee was composed of a tutor, who was appointed to administer the postgraduate education in the hospital, and representatives of the local medical committee. Dr. Townsend hoped that the paragraph would be reworded as suggested by Dr. Ridge, to get the support of the Conference. The existing trainee scheme had come into disrepute because the local medical committees had failed to choose the right trainers. It was a task which they could not do, because, though the majority of members knew their colleagues socially, they did not go into their practices. Consultants often knew a great deal more about general practitioners.

Reply to Debate

Mr. Bowie, in replying to the debate, said that he had sensed a general approval for the report. It had sought to avoid details but to deal with principles. What the committee had had in mind in the question of the duration of appointment of trainers was that if quality among trainers was to be obtained the job must have some security of tenure and teachers an incentive to pursue their subjects. Careful assessment of the trainer and the trainees, and a feed back, would be necessary.

In answer to Dr. Speakman, Mr. Bowie said there was an objection to doing a general practice period soon after the preregistration year. The young doctor might not then have much experience of those specialties which would be of particular importance to him in general practice. On the question of additional income for teachers Mr. Bowie said that in the hospital service there was a system of clinical tutors all over the country, and the money came from the Treasury through the regional hospital boards and not through the University Grants Committee.

Mr. Bowie thought that a department of general practice would present the general practitioner's point of view in all clinical situations in the teaching hospitals. In addition to discussing the clinical condition and the social and other conditions which the general practitioner came up against it was valuable for these situations to be presented to the undergraduate, so that he was introduced to the concepts of general practice.

There was no doubt, Mr. Bowie continued, that Dr. D. L. Williams was right. If young men and women were trained in scientific medicine it would be a waste and a failure if they could not practise that kind of medicine. Therefore it was very important that conditions should be created in general practice in which young graduates could continue in the way they had been trained. It was a dilemma whether to make vocational training compulsory. Preliminary training in hospital practice had become obligatory by custom. What the advisory committee was seeking to do was to provide incentives for vocational training in general practice until custom had time to take over. He hoped that amendments to the report would not be accepted at this stage, but he would take the suggestions to his committee for its further consideration.

Mr. Bowie agreed that supernumerary hospital posts would be useless for training. Dr. Wallis had spoken of what Liverpool was doing, and it was hoped that such a course would become more general. The point about the number of posts available in hospitals and the number of teachers would have to be looked at again. Because of the competition for hospital jobs, there was bound to be complexity.

After a short discussion on the advisability of including Dr. Williams's amendments at this stage the Committee agreed that an expression of the general principle that it would be a waste if young men and women trained in scientific medicine could not apply it in general practice should be included in the report.

It was agreed that the report, as expressing in general the views of the G.M.S. Committee, should be sent to the Royal Commission on Medical Education and to the Central Committee on Postgraduate Medical Education.

It was also agreed that the advisory committee should be asked to revise its report in the light of the debate and to report back to the G.M.S. Committee in due course.

Other Items on Agenda

Review Body

The Chairman, in answer to a question on the forthcoming evidence to be presented to the Review Body, said that it would be presented in two parts—one on behalf of hospital doctors and the other for general practitioners. The hospital doctors had a complicated case, and they had instructed counsel to present it. The general practitioners' case would also be presented by counsel. As last time, the memorandum of evidence on behalf of general practitioners would be published, but not the oral evidence.

Dr. R. A. Keable-Elliott said that many doctors regretted that evidence for the hospital doctors should be given independently. The profession paid lip service to unity, but there would be no unity unless its members presented their case jointly.

The Chairman said that, through the Joint Evidence Committee, the hospital doctors and general practitioners would see each other's case. There would be a general case on behalf of the whole profession and a specific case for each of the two branches. It did not follow that professional unity would be disrupted, so long as one side did not present its case to the prejudice of the other.

Part-time Medical Assistants

Dr. C. J. Wells reported that there had been a meeting with the representatives of the Joint Consultants Committee, and then a tripartite meeting with representatives from the Ministry, to discuss the revised draft of a memorandum prepared by the Ministry on part-time appointments in intermediate medical and dental grades, together with proposals made by the Joint Consultants Committee and the General Medical Services Committee for the remuneration of general practitioners for on-call duties at hospitals.

The Ministry would not agree to any security of tenure for general practitioners now holding posts remunerated under section 94 of the terms and conditions of service. The profession's representatives had told the Ministry that they could not recommend general practitioners to take appointments in the medical assistant grade.

There had also been a discussion on the payments to be made for on-call duties. It had been suggested that payment should be made in two ways: either by a stand-by fee or by an item-of-service payment for each attendance at the hospital. The Ministry's reply, which was before the Committee, was: "The Department has considered the proposals for the remuneration of general practitioners for on-call duties and propose that each side submits evidence separately to the Review Body on this matter." Dr. Wells said his own view was that it would be quite wrong for the G.M.S. Committee to do that, because the Ministry had not yet accepted the principle that this was the method by which these duties should be remunerated. He suggested that no evidence should be given to the Review Body on this point until the Ministry had accepted the principle.

The Ministry now proposed to circulate regional hospital boards to suggest that they should offer part-time appointments in the medical assistant grade to general practitioners. The G.M.S. Committee had sent out about a year ago a recommendation to local medical committees that doctors should be advised not to take up these appointments. Dr. Wells said nothing in the negotiations or in the Ministry's letter had led him to suggest that the Committee should alter its attitude.

Dr. Ridge said that money would be got only from the Review Body. He did not think that the part-time employment of general practitioners in the hospital service should be linked with the fees for stand-by duties, which were an entirely separate matter. An unnecessary delay might be created if a claim for fees for stand-by and casualty work was not included in the next evidence to the Review Body.

The Committee decided that it would be premature to issue a reply to the Minister's letter until there had been further discussions on the whole arrangements for the employment of general practitioners in the hospital service.

Initial Practice Allowances

The Chairman reported that the Minister of Health had now agreed to introduce immediately a scheme for special allowances (to be known as "Type D" initial practice allowances) which would maintain (up to a specified amount) at their previous level the professional earnings of certain doctors who were willing to take up practice in new towns and redevelopment areas concurrently with the arrival of the new residents. These allowances would be offered in areas selected and approved by the Ministry in consultation with the Medical Practices Committee.

Type D allowances were considered appropriate for areas of rapid housing development where a considerable increase in population in comparatively few years was expected, and where it was desirable to have at the outset a doctor of experience and special qualities. The Type D allowance would take the form of a guarantee that the doctor's net annual professional income from all sources, after allowing for practice expenses actually incurred and accepted by the executive council as reasonable, would be made up if necessary to an amount agreed with the executive council as the amount of his previous net annual professional income from all sources subject to a maximum of £4,000 net per annum.

Dr. Goodman suggested that there should be a continuing practice allowance for doctors in redevelopment areas similar to that for the new development areas.

The Committee agreed that the case for a continuing practice allowance in redevelopment areas should be put to the Ministry.

The Chairman also reported that an investigation was being made into recruitment into general practice, and an attempt would be made to see how recruitment in the chronically underdoctored areas could be helped. The planning committee had decided it ought to get first-hand information from the doctors working in those areas, and a group would go to find out what doctors in those areas wanted. Did they want health centres? Did they want help in providing premises? Were the hospital arrangements satisfactory? Nine areas had been selected to begin with, and they were the ones that had been designated for a long time.

"Asset" Case

In reply to Dr. Speakman's request (*Supplement*, 12 August, p. 116) that the Association's solicitor should be consulted about the contract which general practitioners had, the solicitor had written stating that, for the purpose of answering Dr. Speakman's argument, it did not matter whether a general practitioner's contract was with the executive council, with the Minister, or with the executive council as agents for the Minister. It was the terms of the contract that mattered. In short, in the "Asset" case there had been a legally enforcible contract for payment of the new rate. In the case of general practitioners there was not.

Dr. Speakman said that in future when the Prime Minister accepted the Review Body's findings doctors should take no notice of it, because apparently it had no legal effect. They had made a mistake last time in accepting the Prime Minister's word. Another time they should keep the resignation letters until the money was produced. The solicitor had not answered his previous question about the legal basis on which doctors went to the Minister of Health to negotiate with him. The independence of the Review Body had been questioned time and time again. Its independence was built on the quicksands of political expediency, and the Review Body should be referred to as an arbitration tribunal. It was not the final arbiter.

The Chairman explained that there was always the danger that any body could be influenced by the Government. The relationship between the Review Body and the Prime Minister was the same as it had always been. It made recommendations to the Prime Minister. The Prime Minister was not bound to accept the advice of the Review Body any more than the profession was bound to accept its decision. General practitioners were independent contractors.

It was agreed that the matter should not be taken further, except that the exact nature of the general practitioner's contract should be clarified for future reference.

Public Health Medical Officers' Salary Claim

A meeting of Committee C of the Medical and (Hospital) Dental Whitley Council took place on 13 September, at which it was decided to remit the public health medical officers' salary claim to the Officers' Subcommittee of Committee C for further discussion. The position in relation to the claim, including the policy of the B.M.A. in refusing advertisements for public health appointments, will be considered further at a meeting of the Public Health Committee of the Association which will be held on 11 October.

H.M. Forces

A *Supplement* to the *London Gazette* has announced the following awards:

Royal Naval and Royal Marine Forces Reserve Decoration.—Surgeon Commanders C. W. R. Pyne, R. Woodside, Surgeon Lieutenant-Commanders R. A. J. Baily, H. J. S. Waldeck, G. S. Laird, P. W. O'Brien, I. H. Robinson, P. J. Roylance, and J. P. Williams, R.N.R.

Clasp to Royal Naval and Royal Marine Forces Volunteer Reserve Decoration.—Surgeon Lieutenant-Commander P. C. Collinson, V.R.D., R.N.R.

Royal Naval and Royal Marine Forces Volunteer Reserve Decoration.—Surgeon Lieutenant-Commanders R. Burtles, R.N.R., R. K. Newing, R.A.N.R., and N. Roydhouse, R.N.Z.N.V.R.

Territorial Efficiency Decoration.—Lieutenant-Colonel and Brevet Colonel J. Prentice, Lieutenant-Colonels W. Brabbin (now R.A.R.O.), A. G. Mackinnon, Major (Acting Lieutenant-Colonel) J. R. Watson, Majors N. L. Dallas, C. M. Scott, H. H. Sloan, H. Tubmen, and Captain J. R. Skene, R.A.M.C.

ROYAL NAVY

Surgeon Lieutenant-Commanders K. T. Hesketh and R. L. W. Cleave have been placed on the Retired List.

Surgeon Lieutenant-Commander J. R. P. White has been placed on the Emergency List.

Surgeon Lieutenant J. Gerwat to be Surgeon Lieutenant-Commander.

Group Committee: "That this meeting rejects the views stated by the Management Side of Whitley Committee B with reference to mileage allowances (*Supplement*, 19 August, p. 121) for the following reasons: (1) the expenditure properly attributable to motoring on official business is considerably more than the mileage allowance at present obtained as shown by the South-western Region Survey; (2) loan facilities for car hire purchase are not readily available to junior staff, more than 50% of whom already have substantial overdrafts; and asks that the special problems of junior staff on the use of their cars at night, in emergencies and under conditions of stress, be given consideration in the light of the facts now presented."

Dr. G. J. A. **Brown** said the resolution had arisen out of information received from a recent survey in the region. This had shown that consultants in the first two years claimed £180 a year, senior registrars claimed £65, registrars claimed £60, and senior house-officers claimed £35. There were many Commonwealth doctors who did not know what they were entitled to claim.

Dr. **Field** stressed the difficulties of the mileage negotiations and said that although a great deal of information and statistics had been obtained from both the Royal Automobile Club and the Automobile Association the Ministry would not accept the evidence.

Dr. **Pigott** moved: "That this Group Council should seek the support of the Central Committee for Hospital Medical Services in the use of the following limited action to bring pressure to bear on the Ministry—that is, in the area of certain selected hospital groups the use of private cars should cease for a limited period."

Another resolution from the South-western Region which the Group Council considered was: "That, in view of the success of the recent South-western Region survey on the costs of pursuing hospital careers, we propose that these facts be given urgent consideration, and that a similar study should be carried out by experts on a wider scale."

The Group Council supported this resolution.

Grading of Posts

The Group Council considered the following resolution from the South-east Metropolitan Region H.J.S. Committee: "That this meeting is of the opinion that candidates who are appointed to a particular post should be appointed to the grade at which the post was advertised, and not to a lower grade."

The Group Council agreed that the attention of the Central Committee for Hospital Medical Services should be drawn to the matter.

Organization Committee

The first meeting of the session of the Organization Committee was held on 14 September. Dr. J. S. **Noble** was unanimously re-elected Chairman and Dr. J. S. Ross was re-elected Deputy Chairman.

The **Chairman** said that during the year the Committee would be concerned with implementing the new constitution and preparing new standing orders for the Representative Body. Above all, the Committee must look to the membership of the Association.

Honorary Secretaries' Conference

Dr. C. C. **Lutton** strongly objected to the cancellation by the Council of the annual conference of honorary secretaries, and to the statement that medical politics were not within the purview of the conference. He contended that honorary secretaries had to deal with all current affairs, and medical politics were always current.

Dr. D. L. **Gullick**, Under Secretary, said that the conference was primarily to discuss the duties of honorary secretaries. It was impossible to draw a line between organization and medical politics. He suggested that a paper should be produced for the Committee about the future of the conference.

Membership

The **Chairman** said that the United Kingdom membership of the Association had increased by 1,200 in the past five months, but was still down by about 700 on the same time last year. The total membership was down by more than 3,000, but of this loss more than 2,000 was owing to the dissolution of the New Zealand Branch on 30 June. The latest recruiting circular had attracted so far more than 140 applications for membership or renewed membership.

Dr. A. B. **Gilmour**, Assistant Secretary, referring to the new B.M.A. career service, said that it was in many ways a concentration of what had for long been given as a personal service to members. The scope for giving advice on careers was enormous. The new service had been set up under Dr. R. A. Pallister and himself (*Supplement*, 9 September, p. 128). They were concentrating on newly qualified doctors and those interested in how best to prepare for their choice of career in medicine. The service gave individuals basic facts about prospects, and a series of information sheets on different specialties was available.

The **Chairman** hoped that the service would receive publicity and that it would expand. It was the sort of service that a modern professional association must give to its younger members. He congratulated Dr. Pallister and Dr. Gilmour on getting it going so quickly.

Recruitment

Dr. D. **Burrell** remarked that the Council had reduced its expenditure on propaganda, and he recommended that it should be suggested to the Council that if membership declined expenditure on propaganda should be increased.

Dr. **Joan Chappell** asked whether it was right for the Association to remain silent when accusations were made against it. It should advise editors and others what a great deal of work had been done.

Dr. **Ross** said that the feeling in the Association had been that if accusations were answered it led to correspondence, and a small matter could become inflated into something much greater than it really was. So the general policy had been to ignore such criticism. But he thought that policy had been taken too far. It needed to be reviewed, because the Association was, he thought, too cautious.

Dr. **Lutton** said that he encouraged young doctors to attend meetings to sign their applications for membership. He added that the importance of advertising must not be overlooked, and that at the Annual Representative Meeting he had suggested that *B.M.A. News* should be developed as a full-time medical newspaper. He believed that if criticism of the Association was fully answered there would be very little of it in future. Dr. J. M. **Dunlop** emphasized the importance of approaching students about becoming members of the Association as soon as they graduated. Dr. A. W. **Macara** urged the importance of recruitment among medical teachers, saying that students were not being encouraged because their teachers were often non-members.

Dr. R. A. A. R. **Lawrence** said that there was too great a gap between the medico-political functions of the Association and its scientific and academic functions. Many doctors looked upon the Association merely as a medico-political organization, believing that it had nothing to offer in the scientific and academic field. More ought also to be done in the field of postgraduate education. Dr. W. J. C. **Scott** thought that the Association should brush up its scientific image, possibly by joint scientific meetings with the Royal Colleges. He had been told that it was no part of a clinical teacher's job to sell the Association, and he had found teachers anti-Association and resistant to the suggestion that they might encourage young doctors to join it.

The **Chairman** said that the Committee must consider whether the trouble lay in the Association itself, whether it was doing what was right for the profession, whether it had not a more positive place to fill in the future, and whether the Association's relationship with the Royal Colleges and the General Medical Council should be looked at. He was sure that there was evidence of a change in the creation of the Planning Unit. This had benefited the Association, but that good would be maintained only if the Planning Unit produced results.

The Membership and Information Subcommittee, which would consider all these points, had an enormous problem on its hands, said the Chairman.

Dr. **Ross** said that it was by the image that the B.M.A. gave that it would be judged.

While the suggestions that had been made were of the greatest value, care must be taken to treat not only the symptoms but the underlying diseases.

A.R.M. Resolutions

The Committee considered a number of resolutions of the Annual Representative Meeting, 1967. Some were referred to other committees. In two cases it was agreed to ask the sponsoring Divisions to submit suggestions for implementing the resolutions.

The CHAIRMAN said that the memorandum by the East Yorkshire Branch, entitled "Proposals for Reform of the Constitution of the Association," was an important piece of work and that considerable time should be given to it. It was agreed that the matter should be placed on the agenda for the next meeting of the Committee, and that the East Yorkshire Branch should be invited to send representatives to the meeting.

Postgraduate Education

The Committee considered the following motion referred to it by the Council: "That a working party be set up as a matter of urgency to review the Association's policy and participation in the sphere of postgraduate education, and to consider what assistance the Association can give to the individual doctor and to postgraduate centres."

Dr. GILMOUR said that his concern was for the interests of the individual doctor and for the status of the B.M.A. in the world of medical education.

The CHAIRMAN said the subject was vitally important. The Association had an important function in relation to medical education in outlining the needs of the consumer. A planning unit in the field of medical education was needed. There were both short-term and long-term aspects, and the working party would be of value in regard to both.

The Committee agreed to report to the Council in favour of the proposal to set up a working party, and that its terms of reference should be: "To define B.M.A. policy with regard (1) to general principles and central organization in postgraduate activities; and (2) to the individual doctor undertaking postgraduate training; (3) to postgraduate centres."

Concessionary Subscription Rates

The Committee considered an A.R.M. resolution urging that the annual subscription of full-time lower grade university medical teachers should be reduced to 75% of the standard subscription. The Committee also considered a Junior Members Forum resolution advocating concessionary rates for subscriptions related not only to years since qualification but also to net annual income where that was below what might be expected.

The CHIEF ACCOUNTANT told the Committee that the Treasurer would be giving his views, and the CHAIRMAN suggested that the Committee should await the deliberations of the Finance Committee.

The Committee agreed.

Membership of Agenda Committee

The Committee discussed the question of eligibility for service on the Agenda Committee of the Representative Body, raised in a letter from Dr. B. L. Alexander. He pointed out that a member elected to serve on the Agenda Committee for the following year might arrive at the Representative Body meeting not having been re-elected as a representative.

The CHAIRMAN asked the Committee to express its view on whether a member elected to the Agenda Committee should serve until the end of the subsequent Representative Body meeting or subject to his re-election to the Representative Body for the following year.

The Committee decided by five votes to two in favour of the second alternative, and it was agreed to recommend it to the Council for submission to the A.R.M.

Junior Members Forum

The Committee considered the minutes of the Junior Members Forum 1967, and resolutions passed by the Forum about its future.

Dr. A. N. MATHIAS, Chairman of the Representative Body, said that the Forum at Manchester had been excellent and he had been greatly impressed by it. But it rested with the Council to confirm that the Forum should meet annually and on a two-day basis.

Dr. ROSS suggested that the Committee should strongly recommend that the Forum should meet annually for two days.

The Committee agreed.

Future of N.H.S.

The Committee had on its agenda the question of the method of obtaining the views of the profession on the development of the health services.

Dr. MATHIAS said that the subject was being cared for in the Planning Unit, and the General Medical Services Committee also had views about it. The Organization Committee was concerned with the organization of the Association and had a very full task until next year. He suggested that it should stick to its last, which it did with great skill and benefit to the Association, and "let those other people have a go."

The Committee agreed.

Community Services

Community services provided by local health authorities and family doctors are closely interrelated and developments in these services should not be planned in isolation.

This is emphasized in a circular issued by the Scottish Home and Health Department (H.&W.S. 29/1967), in which it is recognized that much has already been achieved in the development of closer co-operation between local health authorities and general practitioners, and between general practitioners and district nurses and midwives. In recent years many authorities have been experimenting in other directions, including the sharing of accommodation in clinic premises and the attachment of health visitors and other ancillary staff to general practitioners.

The circular suggests that to encourage the development of closer working relationships suitable accommodation in existing clinics which is not being fully utilized could be let to general practitioners on a full- or part-time basis. When a local authority is thinking of providing a new clinic local doctors should be consulted early about the possibility of sharing accommodation which would be used only intermittently by the local authority. If doctors want exclusive use of accommodation it is suggested that local authorities might consider building a health centre instead of a clinic. In appropriate cases the Secretary of State would consider delegating the necessary powers to local authorities to provide health centres.

Regional hospital boards should also be consulted when the joint use of premises and other forms of co-operation are being considered. The circular states that the boards might wish part-time use of consulting-rooms in the proposed buildings for out-patient consultations by visiting consultants.

Other suggestions put forward in the circular for consideration include the attachment of field workers to individual practices. The Department will in future tell local health authorities about proposals from general practitioners for new group practice premises, so that local authorities can take the initiative in co-ordinating services. It is also suggested that links through common membership of health service bodies would be further strengthened if local authorities co-opted family doctors to the health committee.

Police Tests in Hospital

The Ministry of Health has issued a circular (H.M.(67)64) commenting on the provisions of the Road Safety Act, 1967, which will affect hospital staff.

From 9 October it will become an offence to drive with more than 80 mg./100 ml. of alcohol in the blood. When a driver who has been in an accident is at hospital as a patient the Act enables the police to require him to provide specimens of breath, blood, or urine for the specified tests.

Under the Act a patient at a hospital is not liable to arrest without warrant, nor can he be required to go elsewhere to give the specimens of breath, blood, or urine.

Specimens may not be taken from a patient without his consent, and a specimen may not be taken from an unconscious patient or by catheterization.

The constable must notify the doctor in immediate charge of the case of the intention to require a patient to provide a specimen, and the doctor may object at any stage before a specimen has been provided if he considers that such action would be prejudicial to the proper examination, diagnosis, care, or treatment of the patient. He may also object to the patient being told of the requirement to provide a specimen or warned of the penalty.

Members of the hospital staff are not required to take part in the taking of specimens or in their evaluation, although the hospital is requested to arrange conditions of privacy under which patients may provide specimens. Hospital equipment will not be used in the tests.

The notification by the constable and any objection by the doctor will both normally be given orally.

The doctor may object on the above grounds at the beginning, or at a later stage, having first not objected. If he objects at any stage before the specimen has been provided the constable may not proceed.

H.M. Forces

Appointments.—Wing Commander J. L. M. Corbet (registrar, Princess Mary's R.A.F. Hospital, Halton); Wing Commander J. J. B. Hobbs (registrar, Princess Mary's R.A.F. Hospital, Akrotiri, Cyprus); Wing Commander A. W. Black (neuropsychiatry duties, R.A.F. Hospital, Wroughton); Wing Commander E. L. Gilbert (senior medical officer, R.A.F. Coltishall).

## ARMY

Brigadier R. T. Shipman, late R.A.M.C., has retired on retired pay.

Colonels J. J. Sullivan, O.B.E., C. C. Corfield, and M. G. Jackson-Smyth, late R.A.M.C., have retired on retired pay.

Lieutenant-Colonel C. D. Sanders, from R.A.M.C., to be Colonel.

ROYAL ARMY MEDICAL CORPS

Major T. H. E. Woods has resigned his commission.

Short Service Commission.—Captain B. Dennison to be Major.

REGULAR ARMY RESERVE OF OFFICERS

Royal Army Medical Corps

Majors D. J. C. Graff and J. A. Moncur, from T. and A.V.R., to be Majors.

TERRITORIAL AND ARMY VOLUNTEER RESERVE

Royal Army Medical Corps

Major J. A. Ward, E.R.D., has resigned his commission, retaining the rank of Major. (Substituted for the notification published in a *Supplement* to the *London Gazette* dated 25 July 1967, and in the *Supplement* to the *Journal*, 19 August, p. 122.)

Captain (Acting Major) J. C. D. Rawlins, from T.A., to be Captain, retaining the acting rank of Major.

Captain L. M. Honigsberger to be Major.

TERRITORIAL ARMY

Territorial Army Reserve of Officers:

Royal Army Medical Corps

Majors (Honorary Lieutenant-Colonels) W. S. Brown, T.D., W. C. Alford, O.B.E., A. V. Dickie, and B. Andrew have resigned their commission, retaining the honorary rank of Lieutenant-Colonel.

Major A. R. Currie has resigned his commission and has been granted the honorary rank of Lieutenant-Colonel.

Majors G. C. Chessor, A. Chambers, T.D., and J. D. Bruzaud have resigned their commissions, retaining the rank of Major.

Captains (Honorary Majors) A. S. Barling and S. H. B. Blaikie have resigned their commissions, retaining the honorary rank of Major.

Improvement Grants

Some changes have been made in the administration of the improvement grant scheme. The main change is that from 1 October executive councils will be responsible for approving grants for projects costing up to £500. When the estimated cost exceeds £500 the Minister's approval will be required, as at present. All doctors providing unrestricted general medical services will be eligible for grants provided their N.H.S. list contains 500 patients or 350 patients in the case of a rural practice.

Grants of one-third of the cost of the approved project, including professional fees and fees paid to the General Practice Advisory Service, will be paid, provided prior approval for the project has been obtained, and provided it is to improve existing practice premises for the provision of general medical services under the National Health Service. There must be adequate security of tenure of the premises, and when the premises are not used solely for N.H.S. practice purposes the grant will be only for that part of the work related to N.H.S. practice. Doctors will have to sign an undertaking that the approved premises will be used for N.H.S. medical practice for a minimum of three years in cases of grants up to £1,000 and four years in grants of over £1,000, and that if this undertaking is not observed they will repay the grant.

Expenses for which grants will not be paid are listed in paragraph 8 of a circular (E.C.N.621), and these include "any project where a contract has been entered into, or work commenced, without the prior approval of the executive council (for projects estimated to cost £500 or less), or the Department (for other projects)."

The Minister will consult representatives of the profession in individual cases of difficulty. Applications already made to executive councils will not be affected by the new arrangements.

B.M.A. Nuffield Library

The Library service is available to all members of the Association resident in Great Britain and Northern Ireland (and by special arrangement to members of the Irish Medical Association). A copy of the library rules will be forwarded on application to the Librarian at B.M.A. House.

The following books have been added to the Library:

Birch, C. A. (Editor): Emergencies in Medical Practice, 8th edition. 1967.
